

# Beyond the Standard Paradigm

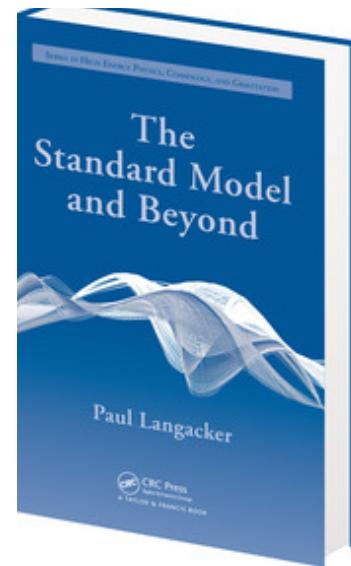

- **Background**
- **The standard paradigm**
- **Uniqueness or environment**
- **The string landscape**
- **Extended MSSM quivers**

## Background

- Career coincided with standard model
  - MIT (1964-1968) (ugrad)  
Experiment? Theory? Mathematics?
  - U. California, Berkeley (1968-1972) (PhD)
  - Rockefeller University (1972-1974) (postdoc)
  - U. Pennsylvania (1974-2006) (postdoc, faculty, Chair)  
Formal theory or “phenomenology”?
  - Institute for Advanced Study and Princeton (2006- ) (“postdoc”)
- Late 60's: unlikely to understand strong or weak in our lifetimes
- 2014: nature understood to  $10^{-16}$  cm (but dark matter/energy; naturalness)
- Hope for 2060: nature understood to Planck scale,  $10^{-33}$  cm  
(need top-down *and* bottom-up *and* cooperative Nature)

- **My research**

- Contact between theory and experiment
- Chiral perturbation theory
- Precision electroweak (global analyses)
- Neutrino mass (early global analyses; MSW sign; sterile abundance)
- BSM (GUTs, beyond MSSM,  $Z'$ , string phenomenology)
- Lecture series
- Textbook: *The Standard Model and Beyond*, (CRC Press, 2010)

# The Standard Model

- Spectacularly successful/unsuccessful
- Mathematically consistent
- Describes nature to  $10^{-16}$  cm
- Recent Higgs discovery
- However, complicated, fine-tuned
- Missing: dark matter and energy
- Most effort is BSM
- Most popular: supersymmetry  
(minimal version [MSSM])

## The Standard Paradigm

- MSSM at TeV scale (but no LHC signal)
- LSP WIMPs (but no clear signal); dark energy (cosmological constant?)
- (Possibly) GUT at unification scale (gauge unification)
- Seesaw model for  $m_\nu$ 
  - Leptogenesis
  - (Possibly) GUT relations for couplings (large representations?)
  - Flavor symmetries (discrete, global, gauge)
- SUSY breaking in hidden sector
- Assumptions of naturalness, uniqueness, minimality

## Beyond the MSSM

Even if TeV-supersymmetry found, MSSM may not be the full story

Most of the problems of standard model remain, new ones introduced  
(FCNC, EDM, proton decay if no  $R_P$ )

$\mu$  problem introduced:  $W_\mu = \mu \hat{H}_u \cdot \hat{H}_d$ ,  $\mu = \mathcal{O}(\text{electroweak})$

Remnants of GUT/Planck scale physics may survive to TeV scale

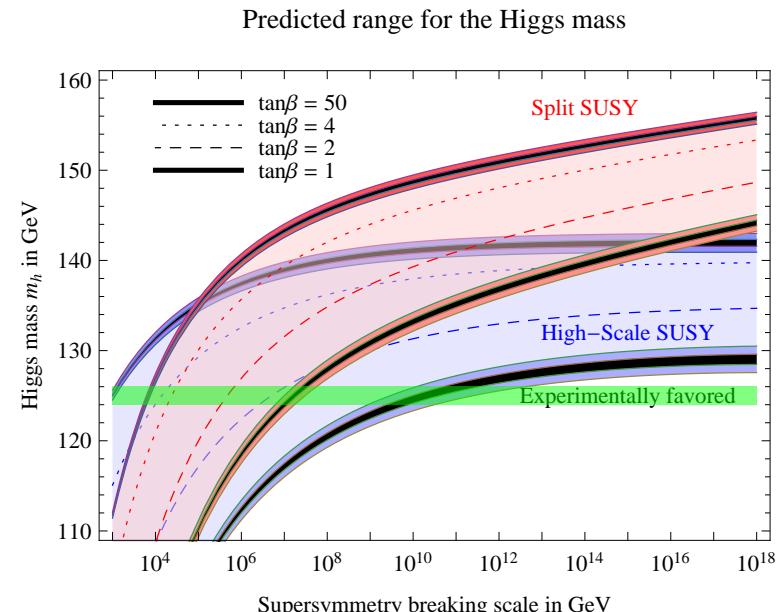

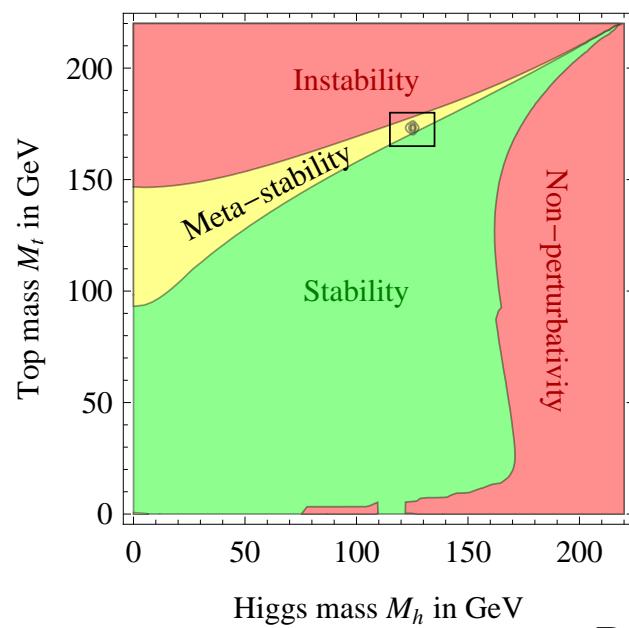

Specific string constructions often have extended gauge groups,  
exotics, extended Higgs/neutralino sectors (defect or hint?)

Ingredients of 4d GUTs hard to embed in string, especially large  
Higgs representations, Yukawa relations

Important to explore alternatives/extensions to MSSM

## Naturalness or Tuning

- ATLAS/CMS: no sign of supersymmetry or other new physics
- Higgs-like particle: consistent with elementary Higgs
  - SM: rather light (metastable vacuum or new physics below  $10^{11}$  GeV)
  - MSSM: rather heavy (need heavy stop or large mixing)

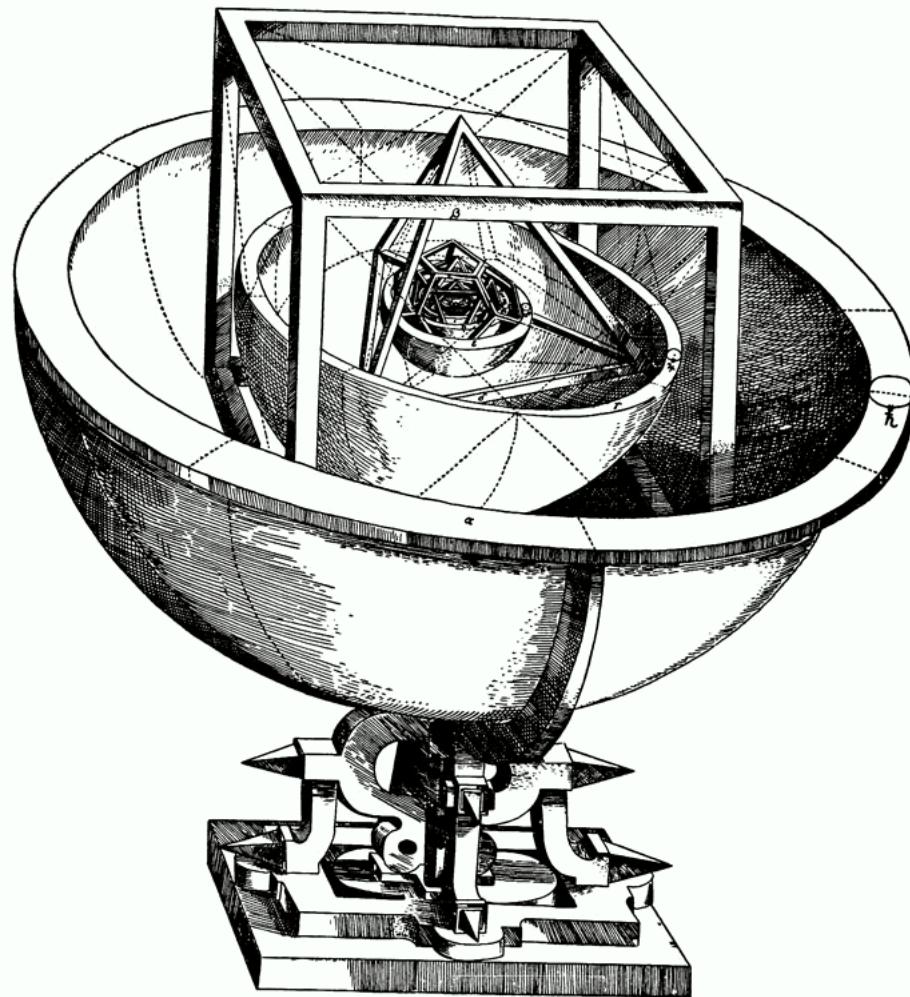

Degrandi et al, 1205.6497

- Higgs mass<sup>2</sup> very unnatural (tuning by  $10^{34}$ ) unless TeV physics (supersymmetry, alternative EWSB, large dimensions)
- Is naturalness a good guide? cf dark energy (tuning by  $10^{120}$ ) (environmental solution?)
- Even for higher-scale new physics: little (baby) hierarchy problem (but reduces FCNC, EDM constraints)

## Uniqueness or Environment

- Gauge interactions: determined by symmetry  
(but groups, representations, SSB)
- Yukawa interactions (flavor physics): apparently unconstrained, unless new symmetries/principles (local, global, discrete, stringy)
- The uniqueness paradigm (cf., Kepler's Mysterium Cosmographicum)
  - Assumption that there is a simple, unique, underlying theory
  - Enormous effort (especially  $\nu$ ) to understand spectrum/mixings by flavor symmetries/textures, usually in seesaw context (tri-bimaximal, bimaximal, complementarity, GUT + flavor, lopsided, Froggatt-Nielsen, haze, loops,  $\mathcal{R}_p$ )
  - $\theta_{13} \neq 0, \theta_{23} \neq 45^\circ$  excludes many models or requires perturbations

# Kepler's Mysterium Cosmographicum

Mainz (16/7/14)

Paul Langacker (IAS/Princeton)

- **The environmental paradigm** (cf., planetary orbits)
  - No simple explanation of parameters  
**(but scales/hierarchies by FN-like powers or exponentials?)**
  - String landscape: may be  $\gtrsim 10^{600}$  vacua with no known selection principle
  - Subset habitable, with different groups, remnants, hierarchy mechanisms, parameters
  - Multiverse sampled by eternal inflation?
  - Environmental selection? **(A word?)**

## Early Speculations

**Horatio:**

*O day and night, but this is wondrous strange!*

**Hamlet:**

*And therefore as a stranger give it welcome.*

*There are more things in heaven and earth, Horatio,  
Than are dreamt of in your philosophy.*

(William Shakespeare: Hamlet, 1603)

- **The environmental paradigm** (contd.)
  - Underlying constraints often too complicated to unravel
  - Version of anarchy
- **Distinction of paradigms critical**

## The String Landscape

- String theory very promising (finite quantum gravity & other interactions)
- However, may be enormous *landscape of vacua* ( $> 10^{600}$ )  
(no known selection principle)
- Many contain SM or MSSM
- Many involve TeV-scale remnants (e.g.,  $Z'$ , exotics, extended Higgs, quasi-hidden sectors) beyond the MSSM (hint?)
- Top-down remnants may not be minimal or motivated by SM problems

# Minimality or Remnants

Mainz (16/7/14)

Paul Langacker (IAS/Princeton)

- Some bottom-up ideas unlikely to emerge from simple/perturbative string constructions  
(e.g., high-dimensional representations; tri-fundamental representations; very large groups; **F theory?**)
- Top-down may suggest new physical mechanisms (e.g., D (string) instantons: exponentially suppressed  $\mu$ , Majorana or Dirac  $m_\nu$ , etc)
- Important to map (perturbative) string-likely or unlikely classes of new physics and mechanisms (and contrast with field theory)

Allowed manifold

SUSY

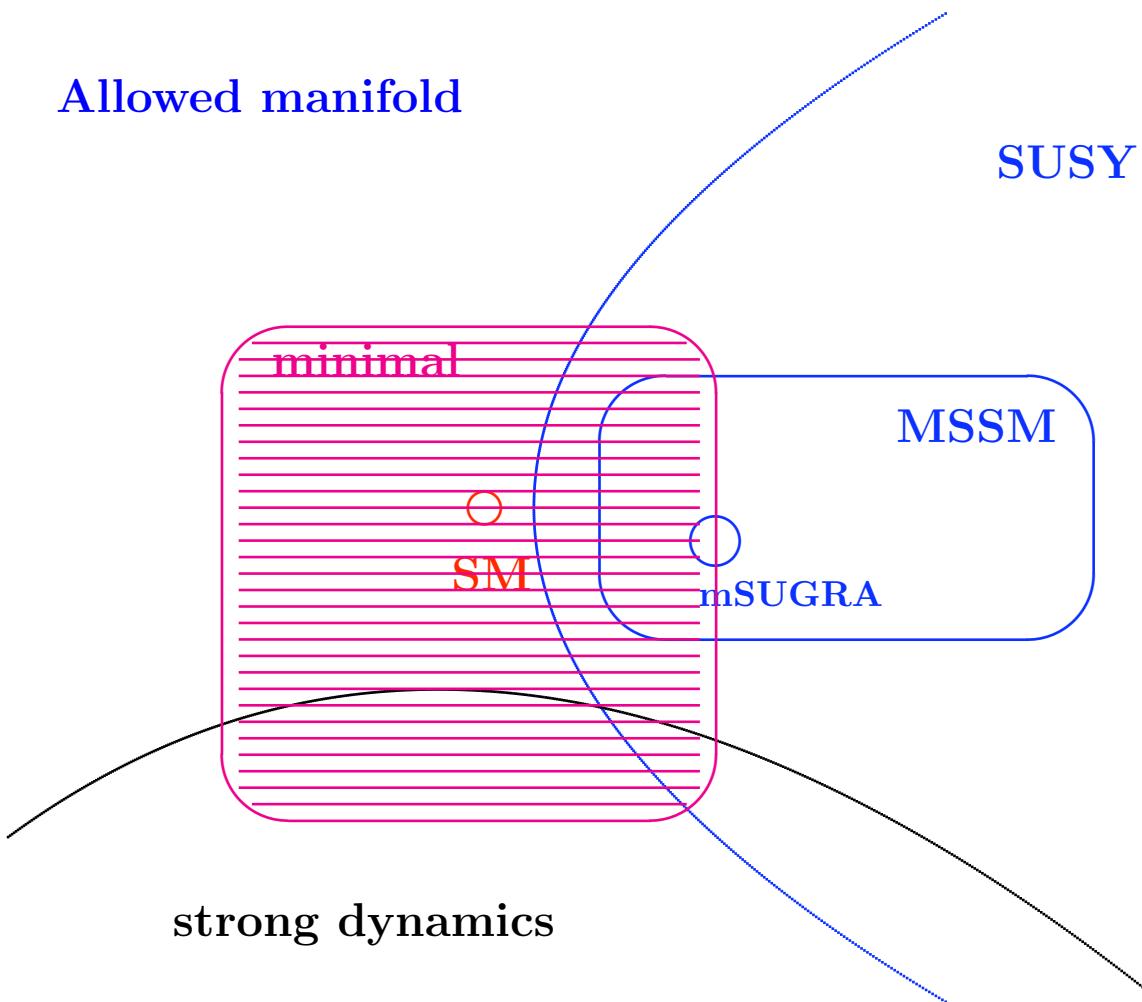

SM

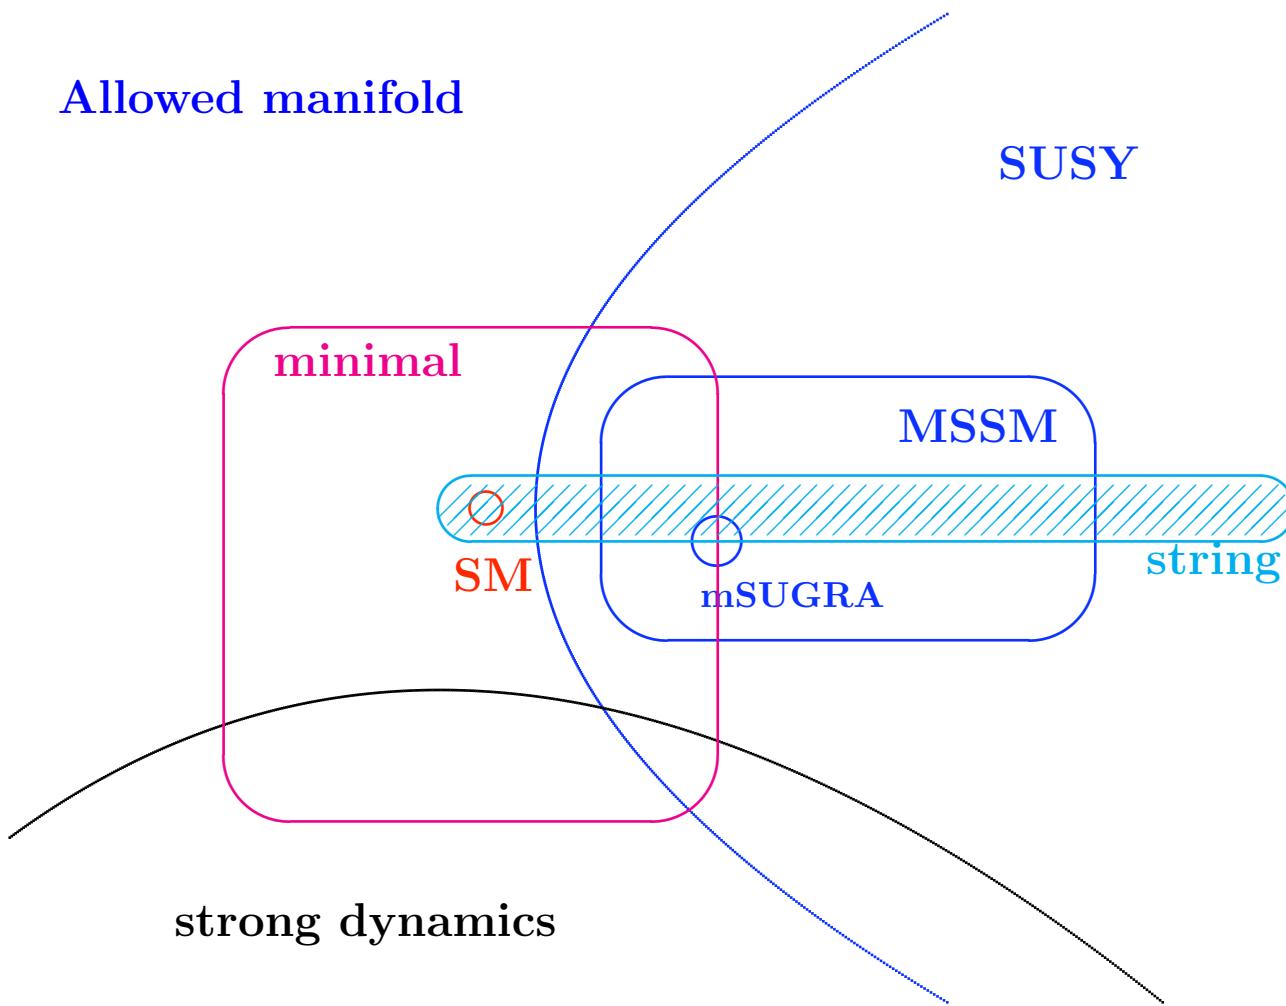

MSSM

mSUGRA

strong dynamics

**Allowed manifold**

## Typical Stringy Effects

- $Z'$  (or other gauge)
- Extended Higgs/neutralino (doublet, singlet)
- Quasi-chiral exotics
- Leptoquark, diquark,  $\mathcal{R}_P$  couplings
- Family non-universality (from different origins) (Yukawas,  $U(1)'$ )
- Various  $\nu$  mass mechanisms (HDO: Majorana or Dirac; D (string) instantons: non-minimal seesaw, Weinberg op, Dirac, sterile)
- (Quasi-)hidden sectors (strong coupling? SUSY breaking? dark matter? random?); may be portals (exotics,  $Z'$ , Higgs)

- Perturbative global symmetries from anomalous  $U(1)'$  (exponentially-suppressed breaking)
- Nonstandard hypercharge embeddings/normalizations
- Fractionally charged color singlets (e.g.,  $\frac{1}{2}$ )  
(confined?, stable relic? millicharged?)
- Large/warped dimensions, low string scale  
(TeV black holes, stringy resonances)
- Axions, moduli, cosmic strings
- Time/space/environment-varying couplings
- LIV, VEP (speeds, decays, [oscillations] of HE  $\gamma$ ,  $e$ , gravity waves, [ $\nu$ 's])

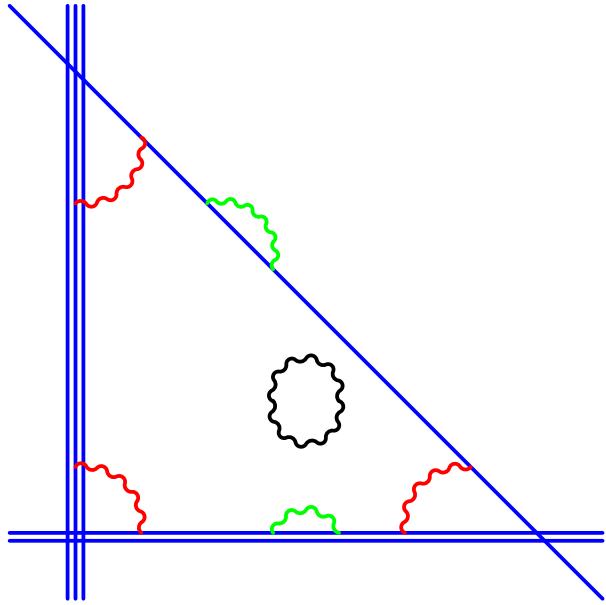

## Surveying the Landscape

- MSSM-like
  - Remnants common (but often explicitly excluded)
  - Extensions of MSSM quivers may be needed (stringy constraints)

- **Counting of group factors, families, etc; MSSM and beyond**

- Denef, Douglas [0404116, 0411183]
- Kumar, Wells [0409218]

- Denef, Douglas, Kachru [0701050]
- AbdusSalam, Conlon, Quevedo, Suruliz [0709.0221]
- Balasubramanian, de Boer, Naqvi [0805.4196]
- Gabella, He, Lukas [0808.2142]
- Anderson, Gray, Lukas, Palti [1106.4804]
- Schellekens [1306.5083]; Gato-Rivera, Schellekens [1401.1782]
- Nibbelink, Loukas [1308.5145]
- Faraggi, Rizos, Sonmez [1403.4107]

## Intersecting Brane (Type IIA) Constructions

- $U(N)$  from  $N$  D6 branes  
(fill 3 of the 6 extra dimensions)
- Adjoints, bifundamentals (open);  
gravitons (closed)
- Also, symmetric, antisymmetric;  
 $SO(2N), Sp(2N)$
- Families from multiple intersections  
(3-cycles wrapping 6d)
- Yukawa interactions  $\sim \exp(-A_{ijk}) \rightarrow$  hierarchies
- Existing models: additional gauge factors, Higgs, chiral matter
- Global  $U(1)$ 's (may be broken by nonperturbative D instantons)

## Tadpoles and Extended MSSM Quivers

Implications of String Constraints for Exotic Matter and  $Z'$ 's Beyond the Standard Model, M. Cvetič, J. Halverson, PL, JHEP 1111,058 (1108.5187);  
Anomaly Nucleation Constrains  $SU(2)$  Gauge Theories, J. Halverson, PRL 111, 261601 (1310.1091)

- Intersecting brane type IIA constructions (and others):  
tadpole cancellation conditions stronger than anomaly cancellation  
in augmented field theory (for  $N_a = 1, 2$ )  
(FT with anomalous  $U(1)$ 's and Chern-Simons terms)

- $U(N_a)$  from stack of  $N_a$  D6 branes:

$$N_a \geq 2 : \quad \#a - \#\bar{a} + (N_a + 4) (\# \square a - \# \bar{\square} a) + (N_a - 4) (\# \square a - \# \bar{\square} a) = 0$$

$$N_a = 1 : \quad \#a - \#\bar{a} + (N_a + 4) (\# \square a - \# \bar{\square} a) = 0 \pmod{3},$$

- $SU(N_a)^3$  triangle anomaly condition for  $N_a \geq 3$
  - Landscape view: all vacua must be consistent

- “Anomalous”  $U(1)$  from trace generator of  $U(N)$  usually acquires Stuckelberg mass near string scale  $M_s$ 
  - Anomalies cancelled by Chern-Simons
  - $U(1) \Rightarrow$  global symmetry on (perturbative) superpotential
  - May be broken by non-perturbative D-instantons (exponentially suppressed)
- Linear combination  $\sum q_x U(1)_x$  may be massless, non-anomalous if
  - $q_a N_a (\#\square_a - \#\overline{\square}_a + \#\squarebar_a - \#\overline{\squarebar}_a) + \sum_{x \neq a} q_x N_x (\#(a, \overline{x}) - \#(a, x)) = 0, \quad \textcolor{red}{N_a \geq 2}$
  - $q_a \frac{\#(a) - \#(\overline{a}) + 8(\#\square_a - \#\overline{\square}_a)}{3} + \sum_{x \neq a} q_x N_x (\#(a, \overline{x}) - \#(a, x)) = 0, \quad \textcolor{red}{N_a = 1}$
  - Require one linear combination  $\Rightarrow$  weak hypercharge,  $Y$
  - May be additional massless combinations, broken by Higgs singlet VEVs  $\Rightarrow$  TeV-scale  $Z'$  (even for  $M_s = \mathcal{O}(M_{pl})$ )

## New Matter and $Z'$ 's

- Most quivers with just MSSM chiral matter don't satisfy tadpole (plus  $H \not\propto L$ ) constraints (none for 3 nodes with no vector pairs)
- Systematically add matter to MSSM quivers to satisfy tadpole and hypercharge conditions (eight 3 and 4-node hypercharge embeddings)
  - Up to 5 additional fields
  - Don't allow purely vector pairs (typically acquire  $M_s$ -scale masses)
  - Allow quasi-chiral pairs (vector under MSSM; chiral under “anomalous” or additional non-anomalous  $U(1)$ 's)
  - May also exclude fractional charge, heavy chiral states, no  $H_d - L$  distinction

SM Rep	Total Multiplicity	Int. El.	4 <sup>th</sup> Gen. Removed	Shifted 4 <sup>th</sup> Gen. Also Removed

- **MSSM singlets with anomalous  $U(1)$  charge**
  - Perturbative NMSSM-like singlet ( $S_\mu H_u H_d$ )  
(alternative: D-instanton)
  - Perturbative  $\nu_L^c$ -like singlet ( $\nu_L^c H_u L$ )  
(alternative: Dirac or Weinberg op by D-instanton)
  - Random
- **Isotriplets ( $Y = 0$ )**

- Quasi-chiral pairs: lepton/Higgs doublets; down-type quark isosinglets; nonabelian singlets ( $Y = Q = \pm 1$ )  
(+ some up-type quark isosinglets, quark isodoublets, shifted lepton/Higgs doublets ( $Q = (\pm 1, \pm 2)$ ))
  - Mass by  $SX\bar{X}$  ( $S =$ MSSM singlet) or  $X\bar{X}$  (D-instantons)
  - Produce quarks/scalar partners by QCD
  - Cascade decays to lightest
  - Decay: mixing, lepto/di-quark, HDO (rapid, delayed, quasi-stable)
  - Many have  $H_d - L$  distinction (necessary for  $L$  and  $R$ -parity conservation)
- Small number fractional charges, chiral fourth family (Landau poles), shifted fourth families:  
 $(3, 2)_{-\frac{5}{6}}, (\bar{3}, 1)_{\frac{1}{3}}, (\bar{3}, 1)_{\frac{4}{3}}, (1, 2)_{-\frac{3}{2}}, (1, 3)_1$

- Quivers with additional (non-anomalous)  $U(1)'$  gauge symmetry
  - $\lesssim 50\%$  are family universal for  $q_L$ ,  $L$ ,  $u_L^c$ ,  $d_L^c$ , and  $e_L^c$
  - Family non-universal (quiver distinct): GIM violation, FCNC ( $B_s$  anomalies?)

Hypercharge	Multiplicity of Quivers

## Conclusions

- **String landscape/eternal inflation: physics may be (partially) environmental**
- **From bottom up: there may be more at TeV scale than MSSM**
- **From top down: there may be more at TeV scale than MSSM (e.g.,  $Z'$ , extended Higgs/neutralino, quasi-chiral exotics, nonstandard  $\nu$ )**
- **Important to delineate difference between string possibilities and field theory possibilities**

# A TeV-Scale $Z'$

Review: Rev.Mod.Phys.81,1199 (arXiv:0801.1345)

- **Strings, GUTs, DSB, little Higgs, LED often involve extra  $Z'$**   
(harder to break  $U(1)'$  factors than non-abelian: remnants)
- **Typically  $M_{Z'} \gtrsim 2 - 3$  TeV for electroweak coupling**  
(LHC, Tevatron, LEP 2, WNC);  $|\theta_{Z-Z'}| < \text{few} \times 10^{-3}$  ( $Z$ -pole)
- **Discovery to  $M_{Z'} \sim 5 - 6$  TeV at LHC-14, higher in  $e^-e^+$**   
( $pp \rightarrow \mu^+\mu^-, e^+e^-, q\bar{q}$ ) (depends on couplings, exotics, sparticles)
- **LHC diagnostics to 1-3 TeV** (BR's, asymmetries, polarizations,  
 $y$  distributions, associated production, rare decays);  
**higher for ILC/CLIC/TLEP**
- **Light (150-300 GeV) leptophobic, TeV-scale (FCNC), or very light**  
( $\lesssim 10$  GeV)  $Z'$  portal (DM)

## String $Z'$

- Non-anomalous, descending through non-abelian group ( $E_6$ ,  $SO(10)$ , Pati-Salam (may be  $T_{3R}$ ,  $T_{BL}$ ,  $E_6$  or “random”))
- Anomalous  $U(1)'$ , e.g., from  $U(N)$  or  $U(1)$  branes
  - Stückelberg masses  $\sim M_{str}$
  - $Z'$  and Chern-Simons term may be observable for  $M_{str} \sim \text{TeV}$
  - Large  $M_{str}$ : may be anomaly-free combinations  
(in addition to  $Y$ ); often family non-universal

## Implications of a TeV-scale $U(1)'$

- Couplings → clues about embedding into underlying theory
- Natural solution to  $\mu$  problem:  $W \sim h_s S H_u H_d \rightarrow \mu_{eff} = h_s \langle S \rangle$   
("stringy version" of NMSSM)
- Supersymmetry:  $SU(2) \times U(1)$  and  $U(1)'$  breaking scales both set by SUSY breaking scale (unless flat direction)
- Extended Higgs sector
  - Relaxed mass limits, couplings, parameters (e.g.,  $\tan \beta \sim 1$ )
  - Higgs singlets needed to break  $U(1)'$
  - Doublet-singlet mixing, extended neutralino sector  
(→ non-standard collider signatures)

- **Extended neutralino sector**
  - Additional neutralinos, non-standard couplings, e.g., light singlino-dominated, extended cascades
  - Additional cold dark matter,  $g_\mu - 2$  possibilities
- **Exotics (anomaly-cancellation)**
  - Non-chiral wrt SM but chiral wrt  $U(1)'$
  - May decay by mixing; by diquark or leptoquark coupling; or be quasi-stable
- **$Z'$  decays into sparticles/exotics (SUSY factory)**
- **Flavor changing neutral currents** (for non-universal  $U(1)'$  charges)
  - Tree-level effects in  $B$  decay competing with SM loops  
*(or with enhanced loops in MSSM with large  $\tan \beta$ )*
  - $B_s - \bar{B}_s$  mixing,  $B_d$  penguins
  - $t\bar{t}$  forward-backward asymmetry *(probably excluded)*

- Non-universal charges: MSW-type effects (apparent CPT violation)
- $Z' - \tilde{Z}'$  mediation of SUSY breaking
- Constraints on neutrino mass generation
  - Various versions allow or exclude Type I or II seesaws, extended seesaw, small Dirac by HDO or non-holomorphic soft; stringy Weinberg operator, Majorana seesaw, small Dirac by string instantons; sterile mixing  
(e.g., Kang, PL, Li; Phys. Rev. D 71, 015012 (2005) [hep-ph/0411404])
- Large  $A$  term and possible tree-level  $CP$  violation  
**(no new EDM constraints)** → electroweak baryogenesis

## Extended Higgs Sector

- Standard model singlets  $S_i$  and additional doublet pairs  $H_{u,d}$  very common
- Additional doublet pairs
  - Richer spectrum, decay possibilities (anomalies?)
  - May be needed (or expand possibilities for) quark-lepton masses/mixings (e.g., stringy symmetries may restrict single Higgs couplings to one or two families)
  - Extra neutral Higgs  $\rightarrow$  FCNC (suppressed by Yukawas)
  - Significantly modify gauge unification (unless compensated)

## Higgs singlets $S_i$

- Standard model singlets common in string constructions
- Needed to break extra  $U(1)'$  gauge symmetries
- Solution to  $\mu$  problem ( $U(1)', \text{NMSSM}, \text{nMSSM}, \text{sMSSM}$ )

$$W \sim h_s S H_u H_d \rightarrow \mu_{eff} = h_s \langle S \rangle$$

- $F(D)$  terms allow larger MSSM-like Higgs mass
- Modified couplings, parameter ranges, branching ratios
- Singlet-doublet mixing
- Large  $A$  term and possible tree-level  $CP$  violation → electroweak baryogenesis

## Quasi-Chiral Exotics

- Often find exotic (wrt  $SU(2) \times U(1)$ ) quarks/leptons at TeV scale
  - Assume non-chiral wrt SM gauge group (strong constraints on SM chiral from large Yukawas ( $\Rightarrow$  Landau poles), precision EW)
  - Can be chiral wrt extra  $U(1)$ 's or other extended gauge
  - Usually needed for  $U(1)$ ' anomaly cancellation
  - Modify gauge unification unless in complete GUT multiplets
  - Strings typically yield (anti-) (bi-) fundamentals, adjoints, (anti-) symmetrics
  - May also be quasi-hidden, shifted charges, or fractional charges

- Examples in 27-plet of  $E_6$

- $D_L + D_R$  ( $SU(2)$  singlets, chiral wrt  $U(1)'$ )
- $\begin{pmatrix} E^0 \\ E^- \end{pmatrix}_L + \begin{pmatrix} E^0 \\ E^- \end{pmatrix}_R$  ( $SU(2)$  doublets, chiral wrt  $U(1)'$ )

- Pair produce  $D + \bar{D}$  by QCD processes (smaller rate for exotic leptons)
- $D$  or  $\tilde{D}$  decay by

- $D \rightarrow u_i W^-$ ,  $D \rightarrow d_i Z$ ,  $D \rightarrow d_i H^0$  if driven by  $D - d$  mixing  
(not in minimal  $E_6$ ; FCNC)
- $\tilde{D} \rightarrow$  quark jets if driven by diquark operator  $\bar{u}\bar{u}\bar{D}$ , or quark jet + lepton for leptoquark operator  $lq\bar{D}$  (still have stable LSP)
- May be stable at renormalizable level due to accidental symmetry (e.g., extended gauge group) → hadronizes and escapes or stops in detector (quasi-stable from HDO  $\rightarrow \tau < 1/10$  yr)  
(Kang, PL, Nelson, Phys.Rev. D77, 035003 (arXiv:0708.2701))

- **Applications:**  $H \rightarrow \gamma\gamma$ , dark matter, baryogenesis,  $B$ -mixing/decays, FCNC, flavor structure,  $A_{FB}^b$ , gauge mediation

## Small neutrino masses

- Many mechanisms for small  $m_\nu$ , both Majorana and Dirac
- Minimal Type I seesaw
  - Bottom-up motivation: no gauge symmetries prevent large Majorana mass for  $\nu_R$
  - Connection with leptogenesis
  - Argument that  $L$  must be violated is misleading  
[non-gravity: large 126 of  $SO(10)$  or HDO added by hand]  
[gravity:  $m_\nu \lesssim \nu_{EW}^2 / \overline{M}_P \sim 10^{-5}$  eV (unless LED); often much smaller]
  - New TeV or string scale physics/symmetries/constraints may invalidate assumptions  
[No 126 in string-derived  $SO(10)$ ]
- Bottom-up alternatives: Higgs (or fermion) triplets, extended (TeV) seesaws, loops,  $R_p$  violation

- **String-motivated alternatives**

(review: ARNPS, 62, 215; arXiv:1112.5992)

- **Higher-dimensional operators (HDO)**

[non-minimal seesaw (not GUT-like), direct Majorana (Weinberg op), small Dirac (e.g.,  $U(1)'$  or non-holomorphic soft), mixed (LSND, MiniBooNE)]

- **String instantons (exponential suppressions)**

[non-minimal seesaw, direct Majorana, small Dirac]

- **Geometric suppressions (large dimensions) [small Dirac]**

- **Alternatives often associated with new TeV physics, electroweak baryogenesis, etc.**

## MSSM hypercharge embeddings

(Ibanez, Marchesano, Rabadan; Anastasopoulos, Dijkstra, Kiritsis, Schellekens)

- Three-node embeddings ( $U(3)_a \times U(2)_b \times U(1)_c$ )

$$\text{Madrid: } U(1)_Y = \frac{1}{6} U(1)_a + \frac{1}{2} U(1)_c$$

$$\text{non-Madrid: } U(1)_Y = -\frac{1}{3} U(1)_a - \frac{1}{2} U(1)_b$$

- Four-node embeddings ( $U(3)_a \times U(2)_b \times U(1)_c \times U(1)_d$ )

$$U(1)_Y = \frac{1}{6} U(1)_a + \frac{1}{2} U(1)_c + \frac{1}{2} U(1)_d \quad U(1)_Y = -\frac{1}{3} U(1)_a - \frac{1}{2} U(1)_b + \frac{1}{2} U(1)_d$$

$$U(1)_Y = \frac{1}{6} U(1)_a + \frac{1}{2} U(1)_c + \frac{3}{2} U(1)_d \quad U(1)_Y = -\frac{1}{3} U(1)_a - \frac{1}{2} U(1)_b$$

$$U(1)_Y = \frac{1}{6} U(1)_a + \frac{1}{2} U(1)_c \quad U(1)_Y = -\frac{1}{3} U(1)_a - \frac{1}{2} U(1)_b + U(1)_d,$$

- Remove quivers leading to fractionally charged color singlets
- Require  $H_d$  quiver-distinct from 3  $L$ -doublets  
(necessary for  $L$ ,  $R$ -parity conservation)
- Perturbative NMSSM-like singlet ( $S_\mu H_u H_d$ ) (alternative: D-instanton)
- Perturbative  $\nu_L^c$ -like singlet ( $\nu_L^c H_u L$ )  
(alternative: Dirac or Weinberg op by D-instanton)

- Quivers with additional  $U(1)'$  gauge symmetry
- $\lesssim 50\%$  are family universal for  $q_L$ ,  $L$ ,  $u_L^c$ ,  $d_L^c$ , and  $e_L^c$
- Family non-universal (quiver distinct): GIM violation, FCNC  
( $B_s$  anomalies?)
