## After Higgs discovery: Open questions

Higgs discovery in 2012  $\Rightarrow$  last building block discovered

? Any remaining questions ?

- Why is the SM the way it is ??
  - $\Rightarrow$  search for underlying principles/ symmetries
- find explanations for observations not described by the SM
  - $\Rightarrow$  e.g. dark matter, flavour structure, ...
- ad hoc approach: Test which other models still comply with experimental and theoretical precision

for all: Search for Physics beyond the SM (BSM)

 $\Longrightarrow$  main test ground for this: particle colliders  $\Longleftarrow$ 

- 3

## Special role of the scalar sector

Higgs potential in the SM

$$\mathbf{V} = -\mu^2 \, \mathbf{\Phi}^{\dagger} \, \mathbf{\Phi} + \lambda \, \left( \mathbf{\Phi}^{\dagger} \, \mathbf{\Phi} \right)^2, \quad \mathbf{\Phi} = \frac{1}{\sqrt{2}} \begin{pmatrix} \mathbf{0} \\ \mathbf{v} + \mathbf{h}(\mathbf{x}) \end{pmatrix}$$

 $\Rightarrow$  mass for Higgs Boson and Gauge Bosons

$$m_h^2 \,=\, 2\,\lambda\,v^2,\, m_W \,=\, g\, \frac{v}{2},\, m_Z \,=\, \sqrt{g^2 + (g')^2}\, \frac{v}{2}$$

where v: Vacuum expectation value of the Higgs field, g, g'': couplings in  $SU(2) \times U(1)$ 

 $\Rightarrow$  everything determined in terms of gauge couplings, v, and  $\lambda$ 

#### form of potential determines minimum, electroweak vacuum structure

- $\Rightarrow$  stability of the Universe, electroweak phase transition, etc
- full test requires checks of *hhh*, *hhhh* couplings
- $\Rightarrow$  so far: only limits; possible only at future machines [HL-LHC: constraints on hhhh]

Tania Robens

Extended scalar sectors

Pushing the Limits, 8.5.23

< □ > < 同 > < 回 > <

## Models

- new scalars  $\Rightarrow$  models with scalar extensions
- many possibilites: introduce new SU(2) × U(1) singlets, doublets, triplets, ...
- unitarity ⇒ important sum rule\*

$$\sum_{i}g_{i}^{2}(h_{i})=g_{SM}^{2}$$

for coupling g to vector bosons

• many scenarios  $\Rightarrow$  signal strength poses strong constraints

\* modified in presence e.g. of doubly charged scalars, see Gunion, Haber, Wudka, PRD 43 (1991) 904-912.

Tania Robens

Extended scalar sectors

Pushing the Limits, 8.5.23

- 31

## What about extensions ?

• in principle: no limit

can add more singlets/ doublets/ triplets/ ...

⇒ consequence: will enhance particle content

additional (pseudo)scalar neutral, additional charged, doubly charged, etc particles

common feature:

new scalar states, which can now also be produced/ decay into each other/ etc

< ロ > < 同 > < 回 > < 回 > < 回 >

#### typical content: singlet extensions ⇒ additional CP-even/ odd mass eigenstates 2HDMs, 3HDMs: add additional charged scalars

- e.g. 2 real scalars  $\Rightarrow$  **3 CP-even neutral scalars**
- $\bullet~2\text{HDM}\to 2$  CP-even, one CP odd neutral scalar, and charged scalars

• ...

## Example: Two Higgs Doublet Models

a popular extension: Two Higgs Doublet models

- extend SM scalar sector by one additional doublet
- a priori: can lead to flavour changing neutral currents
- way to prevent this: introduce additional symmetries in potential

particle content: 
$$\underbrace{h, H}_{CP-even}, \underbrace{A}_{CP-odd}, H^{\pm}$$

parameters: **masses**, + tan  $\beta$ , cos  $(\beta - \alpha)$ ,  $m_{12}$ 

- also subject to various constraints: **B-physics, direct** searches, signal strength, ...
- different types of Yukawa couplings ⇒ different effects of constraints

## Consequences of combining constraints: flavour, electroweak precision, and signal strength

- non-singlet scenarios: also strong constraints from flavour
- typical example: 2HDMs, constraints in the  $(m_{H^{\pm}}, \tan \beta)$ plane
- $\Rightarrow$  sets lower limit on charged mass
- $\Rightarrow$  strongly correlated to other additional masses via electroweak precision measurements (*S*, *T*, *U*)

#### Lower mass bound on additional scalars

- Consequence: "typical" channels at  $e^+e^-$  colliders [e.g. *HA*] require higher center of mass energies [e.g. TeV range]
- example here: THDMa (2HDM+ singlet) [TR, Symmetry 13 (2021) 12,

2341]

Tania Robens

Extended scalar sectors

### Example: B- physics constraints [TR, PoS ICHEP2022 176]

Constraints from 
$$B \rightarrow X_s \gamma, B_s \rightarrow \mu^+ \mu^-, \Delta M_s$$

- $B \rightarrow X_s \gamma$ : use fit from updated calculation of Misiak ea, [JHEP 2006 (2020) 175, Eur.Phys.J. C77 (2017) no.3, 201],  $\Rightarrow \tan \beta_{\min} (m_{H^{\pm}})$
- $B_s \rightarrow \mu^+ \mu^-$ ,  $\Delta M_s$ : via SPheno, compare to PDG value, HFLAV value [Eur.Phys.J.C 81 (2021) 3, 226]

$$\begin{split} R_{\gamma}^{\text{exp}} &\equiv \frac{\mathcal{B}_{(s+d)\gamma}}{\mathcal{B}_{\mathcal{C}\ell\nu}} = (3.22 \pm 0.15) \times 10^3, \\ \Delta M_s \, (\text{ps}^{-1}) &= 17.757 \pm 0.020 \pm 0.007, \\ \left(\mathcal{B}_s \to \mu^+ \mu^-\right)^{\text{PDG}} &= [3.01 \pm 0.35] \times 10^{-9} \end{split}$$

Image: A math a math

Tania Robens

Extended scalar sectors

#### Oblique parameters via SPheno, compare to GFitter [Eur. Phys. J., C78(8):675]

### In this particular case: ...

• In a general scan [letting 10 parameters float]:

heavy scalar masses  $\gtrsim\,500\,{\rm GeV}$ 

Consequence

• channels as e.g. HA only accessible for  $\gtrsim 1 \,\mathrm{TeV}$ "partonic" center of mass energies

[statement different for other Yukawa structures]

## Testing the Higgs potential

• remember:

$$\mathbf{V} = -\mu^2 \, \mathbf{\Phi}^{\dagger} \, \mathbf{\Phi} + \lambda \, \left( \mathbf{\Phi}^{\dagger} \, \mathbf{\Phi} 
ight)^2, \quad \mathbf{\Phi} = rac{1}{\sqrt{2}} egin{pmatrix} \mathbf{0} \ \mathbf{v} + \mathbf{h}(\mathbf{x}) \end{pmatrix}$$

also predicts hhh and hhhh interactions

• so far: only constraints

 $\implies$  future accessibility ? <=

Start with resonance enhanced BSM scenarios for *hhh* 

Tania Robens

Extended scalar sectors

## Exploration of $h_1h_1h_1$ final state at HL-LHC

[A. Papaefstathiou, TR, G. Tetlalmatzi-Xolocotzi, JHEP 05 (2021) 193]

• 3 scalar states  $h_1$ ,  $h_2$ ,  $h_3$  that mix

 $\begin{array}{c} \text{concentrate on} \\ p \ p \ \rightarrow \ h_3 \ \rightarrow \ h_2 \ h_1 \ \rightarrow \ h_1 \ h_1 \ h_1 \ \rightarrow \ b \ \overline{b} \ b \ \overline{b} \ b \ \overline{b} \\ \end{array}$ 

- $\Rightarrow$  select points on BP3 which might be accessible at HL-LHC
- ⇒ perform detailed analysis including SM background, hadronization, ...
  - tools: implementation using full t, b mass dependence, leading order [UFO/ Madgraph/ Herwig] [analysis: use K-factors]

## What about Higgs factories ?

#### $e^+ e^- \rightarrow Z^* \rightarrow Zh, e^+ e^- \rightarrow \nu \bar{\nu} h$ (VBF)

LO analytic expressions e.g. in Kilian ea, Phys.Lett.B 373 (1996) 135-140]

- rule of thumb: rescaling  $\leq 0.1$
- $\Rightarrow$  maximal production cross sections around 50 fb
- $\sim 10^5$  events using full luminosity

Tania Robens

Extended scalar sectors

# Singlet extensions [TR, arXiv:2203.08210 and Symmetry 2023, 15(1), 27]

#### TRSM: 2 real singlets [TR, T. Stefaniak, J. Wittbrodt, Eur.Phys.J.C 80 (2020) 2, 151]

cross sections at 250 GeV

convoluted with decay rates

final states:  $Z b \overline{b}$ ,  $Z h_1 h_1$ ,  $Z c \overline{c}$ ,  $Z \tau^+ \tau^-$ 

Tania Robens

Extended scalar sectors

## $h \rightarrow 4j/4b/4c$ final states, Z h production

[Z. Liu, L.-T. Wang, H. Zhang, Chin.Phys.C 41 (2017) 6, 063102]

95% CL bounds,  $\sqrt{s} = 240 \,\text{GeV}, \int \mathcal{L} = 5 \,\text{ab}^{-1}$

## Singlet extension, with connection to strong first-order electroweak phase transition

#### [J. Kozaczuk, M. Ramsey-Musolf, J. Shelton, Phys.Rev.D 101 (2020) 11, 115035]

blue band = strong first-order electroweak phase transition

#### comment: current constraints lead to prediction $\lesssim 10^{-1}$

[invisible BR, signal strength, assumes SM-like decay to bs] [projections taken from Z. Liu, L.-T. Wang, and H. Zhang, Chin. Phys. C 41, 063102 (2017)]<sup>1</sup> (2017)]<sup>1</sup> (2017)]<sup>1</sup> (2017)<sup>1</sup> (2017)<sup>1</sup>

## Summary

Models with extended scalar sectors provide an interesting setup to introduce new scalar particles, with different CP/ charge quantum numbers

⇒ leads to many new interesting signatures, some of which are not yet covered by current searches

some of these: also interesting connections of electroweak phase transitions/ gravitational waves/ etc

#### Next steps

• (re) investigate models with extended scalar sectors at  $e^+e^-$  colliders

#### Many things to do

Tania Robens

 $) \land ( \bigcirc )$ 

Э

Different ways to see new physics effects

- Option 1: see a direct deviation, in best of all cases a bump, and/ or something similar ⇒ clear enhanced rates for certain final states, mediated by new physics
- Option 2: observe signatures that do not exist in SM, e.g. events with large missing energy (hint of model containting DM)
- Option 3: observe deviations in SM-like quantities which are small(ish): ⇒ loop-induced deviations, requiring precision measurements
- NB: these can in principle also be large  $!! \Rightarrow$  all models floating around to explain  $m_W^{\rm CDF}$

Tania Robens

Extended scalar sectors

## What about other extensions ?

• in principle: no limit

can add more singlets/ doublets/ triplets/ ...

⇒ consequence: will enhance particle content

additional (pseudo)scalar neutral, additional charged, doubly charged, etc particles

common feature:

new scalar states, which can now also be produced/ decay into each other/ etc

< ロ > < 同 > < 回 > < 回 > < 回 >

## Other possible extensions

- A priori: no limit to extend scalar sector
- make sure you
  - have a suitable ew breaking mechanism, including a Higgs candidate at  $\sim~125\,{\rm GeV}$
  - can explain current measurements
  - are **not excluded by current searches** and precision observables
- nice add ons:
  - can push vacuum breakdown to higher scales
  - can explain additional features, e.g. dark matter, or hierarchies in quark mass sector

• ...

- Multitude of models out there
- adding ew gauge singlets/ doublets/ triplets...

```
\Rightarrow new scalar states \Leftarrow
```

Pushing the Limits, 8.5.23

Tania Robens

Extended scalar sectors

#### Constraints

#### • Theory

minimization of vacuum (tadpole equations), vacuum stability, positivity, perturbative unitarity, perturbativity of couplings

#### Experiment

provide viable candidate @ 125 GeV (coupling strength/ width/ ...); agree with null-results from additional searches and ew gauge boson measurements (widths); agree with electroweak precision tests (typically via S,T,U); agree with astrophysical observations (if feasible)

#### Limited time $\Rightarrow$ next slides highly selective...

## LHC: Multi scalar production modes

[TR, T. Stefaniak, J. Wittbrodt, Eur.Phys.J. C80 (2020) no.2, 151]

#### ADDING TWO REAL SCALAR SINGLETS

Scalar potential  $(\Phi: SU(2)_L \text{ doublet, } S, X: SU(2)_L \text{ singlets})$ 

$$\begin{split} \mathcal{V} = & \mu_{\Phi}^2 \Phi^{\dagger} \Phi + \mu_{S}^2 S^2 + \mu_{\chi}^2 X^2 + \lambda_{\Phi} (\Phi^{\dagger} \Phi)^2 + \lambda_{S} S^4 + + \lambda_{\chi} X^4 + \\ & \lambda_{\Phi S} \Phi^{\dagger} \Phi S^2 + \lambda_{\Phi \chi} \Phi^{\dagger} \Phi X^2 + \lambda_{S \chi} S^2 X^2. \end{split}$$

Imposed  $\mathbb{Z}_2 \times \mathbb{Z}_2'$  symmetry, which is spontaneously broken by singlet vevs.

 $\Rightarrow$  three CP-even neutral Higgs bosons:  $h_1, h_2, h_3$ 

Two interesting cases:

**Case (a):**  $\langle S \rangle \neq 0, \langle X \rangle = 0 \Rightarrow X$  is DM candidate;

**Case (b):**  $\langle S \rangle \neq 0, \langle X \rangle \neq 0 \Rightarrow$  all scalar fields mix.

Again, Higgs couplings to SM fermions and bosons are *universally* reduced by mixing.

Tim Stefaniak (DESY) | BSM Higgs physics | ALPS 2019 | 27 April 2019

#### Possible production and decay patterns

 $M_1 \leq M_2 \leq M_3$ 

Production modes at pp and decays

$$pp \rightarrow h_3 \rightarrow h_1 h_1;$$
  $pp \rightarrow h_3 \rightarrow h_2 h_2;$   
 $pp \rightarrow h_2 \rightarrow h_1 h_1;$   $pp \rightarrow h_3 \rightarrow h_1 h_2$ 

 $h_2 \rightarrow SM; h_2 \rightarrow h_1 h_1; h_1 \rightarrow SM$ 

 $\Rightarrow$  two scalars with same or different mass decaying directly to SM, or  $h_1 h_1 h_1$ , or  $h_1 h_1 h_1$ 

 $[h_1 \text{ decays further into SM particles}]$ 

 $\begin{bmatrix} BRs \text{ of } h_i \text{ into } X_{SM} = \frac{\kappa_i \Gamma_{h_j \to X}^{SM}(M_i)}{\kappa_i \Gamma_{tot}^{SM}(M_i) + \sum_{j,k} \Gamma_{h_j \to h_j} h_k}; \kappa_i: \text{ rescaling for } h_i \end{bmatrix}$ Tania Robens
Extended scalar sectors
Pushing the Limits, 8.5.23

## Benchmark points/ planes [ASymmetric/ Symmetric]

AS BP1:  $h_3 \rightarrow h_1 h_2$  ( $h_3 = h_{125}$ )

SM-like decays for both scalars:  $\sim~3\,{\rm pb};\,h_1^3$  final states:  $\sim~3{\rm pb}$ 

AS BP2:  $h_3 \rightarrow h_1 h_2$  ( $h_2 = h_{125}$ )

SM-like decays for both scalars:  $\sim~0.6\,\mathrm{pb}$ 

AS BP3:  $h_3 \rightarrow h_1 h_2$  ( $h_1 = h_{125}$ )

(a) SM-like decays for both scalars  $\sim 0.3\,{
m pb}$ ; (b)  $h_1^3$  final states:  $\sim 0.14\,{
m pb}$ 

**S BP4:**  $h_2 \rightarrow h_1 h_1$  ( $h_3 = h_{125}$ )

up to 60 pb

**S BP5:**  $h_3 \rightarrow h_1 h_1$  ( $h_2 = h_{125}$ )

up to  $2.5\,\mathrm{pb}$ 

**S BP6:**  $h_3 \rightarrow h_2 h_2$  ( $h_1 = h_{125}$ )

SM-like decays: up to 0.5 pb;  $h_1^4$  final states: around 14 fb

Tania Robens

Extended scalar sectors

- many different future colliders are discussed [past- HL-LHC]
- o current focus: Higgs factories (e<sup>+</sup>e<sup>−</sup>, √s ~ 250 GeV) interesting: compare possible reach ?
- will do a \_superficial\_ comparison for a specific model
- of course more detailed studies called for

#### various production modes possible

- 1) easiest example:  $e^+ e^- \rightarrow Z h_1$ , onshell production interesting up to  $m_1 \sim 160 \, {\rm GeV}$
- 2) in models with various scalars: e.g. also  $e^+ e^- \rightarrow h_1 h_2$ (e.g. from 2HDMs); example processes and bounds from LEP in Eur.Phys.J.C 47 (2006) 547-587

again: for onshell production,  $\sum_i m_i \leq 250 \, {\rm GeV}$ 

3) another (final) option: look at  $e^+e^- \rightarrow h_i Z$ ,  $h_i \rightarrow h_j h_k$ 

#### already quite a few studies for 1), 3) available

(日) (同) (三) (

# Singlet extensions [TR, arXiv:2203.08210 and Symmetry 2023, 15(1), 27]
