Is Dark Matter yet another particle?

P.S: ★ Marks discussion points for today afternoon

... at the Large Hadron Collider

World's largest and most powerful particle accelerator.
Circumference of 27 km, running underground across the borders of Switzerland
and France.

Hidden Sectors

SM Sector

Connectors /
Portals

Hidden
Sectors

Z' , SUSY particles,
Higgs, Extra Dim,
Leptoquarks,
CP-odd...

can be strongly
or weakly coupled
i.e., dark Higgs,
dark photon,
dark $SU(N)$,
Asym DM...

When a Hidden Sector particle is (quasi-)stable, a dark matter candidate can potentially exist

We have not found any concrete sign of new physics ... yet!

Looking at unusual topologies and hidden corners of the phase space
→ **signature based searches, using benchmark models.**

Note: Any hidden sector with more than one particle in it generically contains unstable particles. These are often long-lived due to tiny SM portal couplings being only decay (and collider production) channel [see [backup](#)]

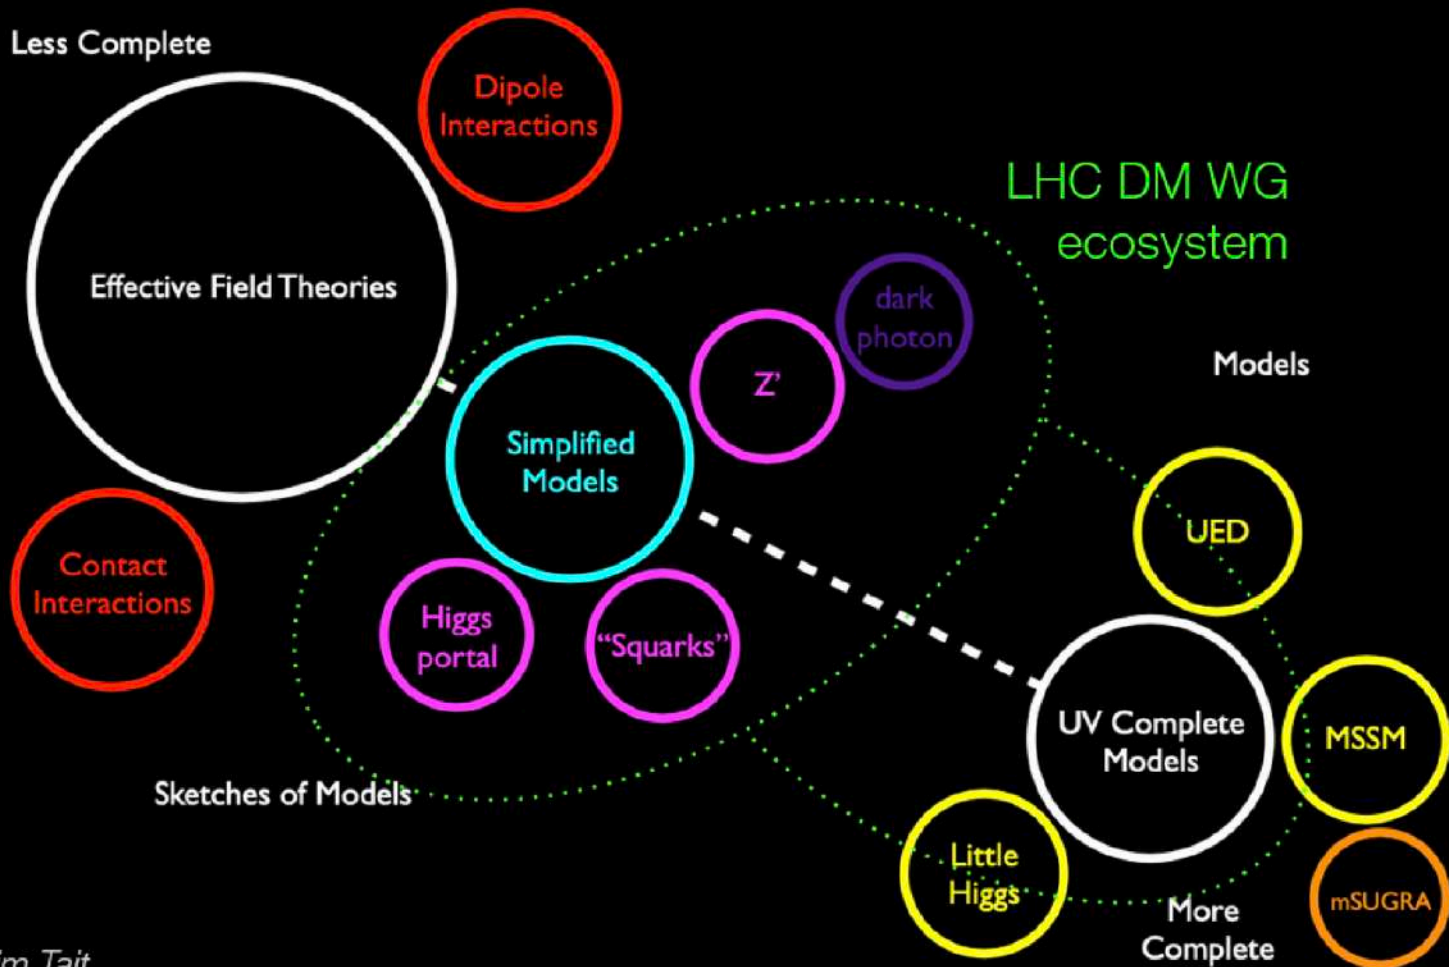

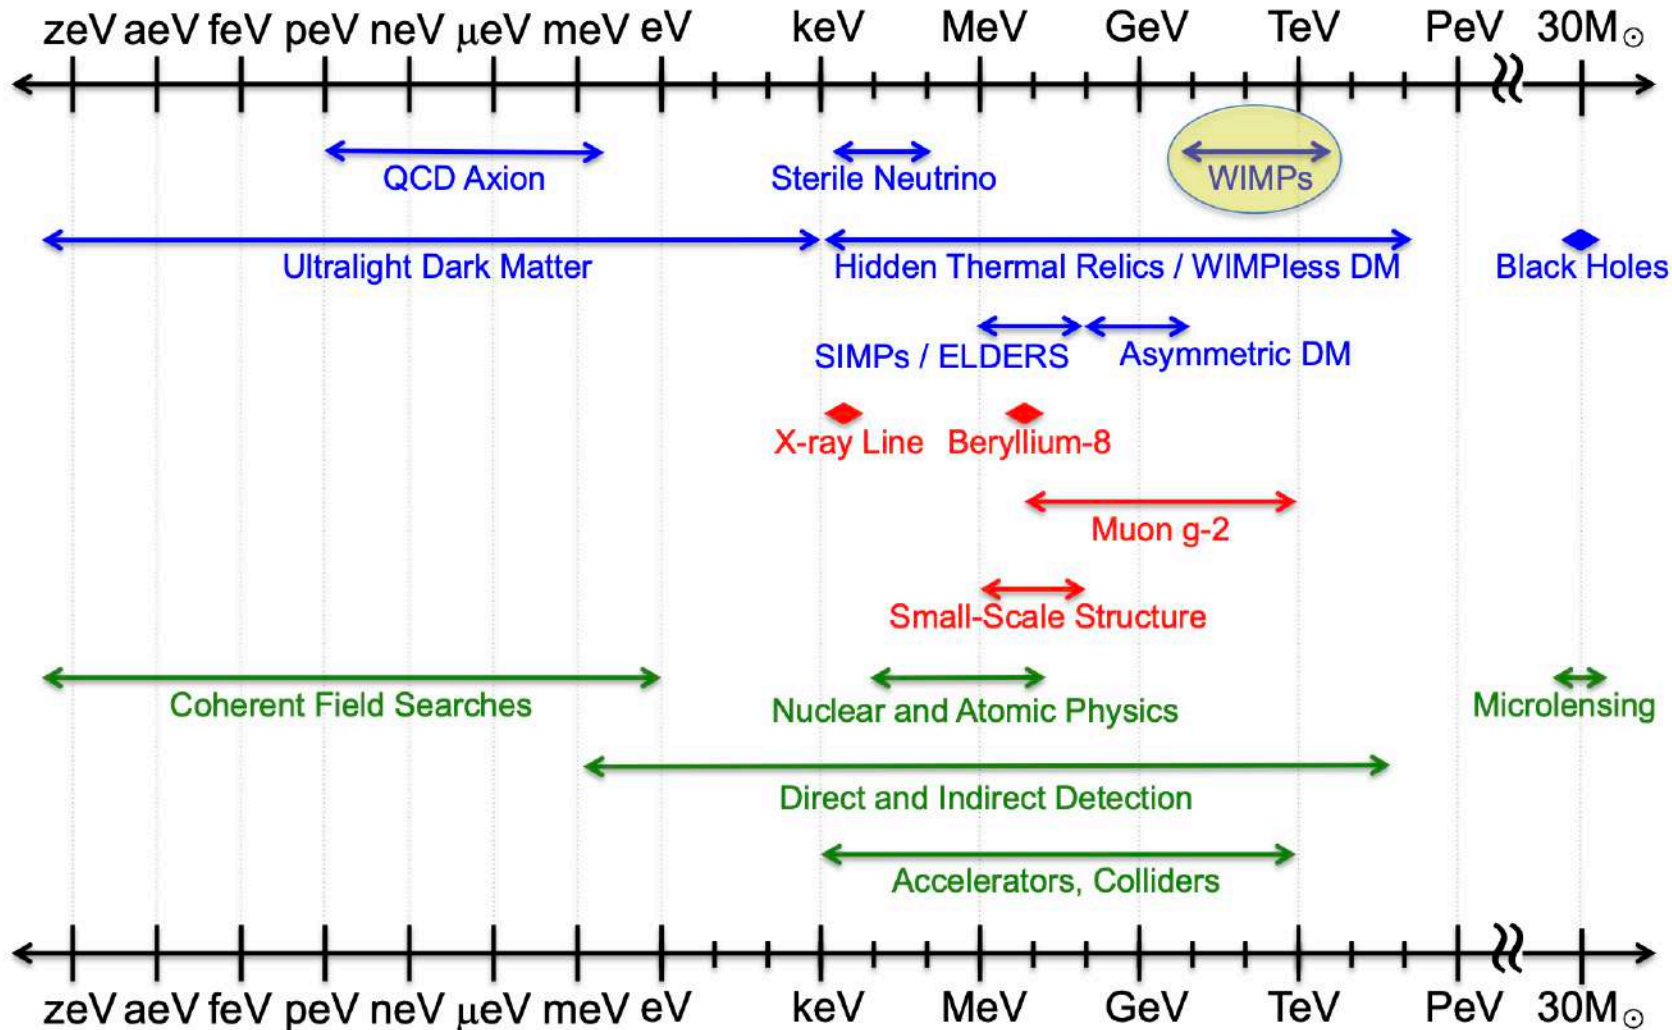

Figure: Tim Tait

WIMPs

The miracle... WIMPs motivated by

- cosmology (production mechanism of thermal freeze-out, expected to have right relic density)
- particle theory (i.e. present in many BSM models)
- particle experiment (accessible in current and near-future energy scales)

Complementarity of various WIMP dark matter detection methods

Direct WIMP production of $\chi\chi$ pairs is invisible
→ must look for signatures of WIMPs produced in conjunction with other particles.

If SUSY: pair of squarks/gluinos → neutralino WIMP (i.e. MET) (not discussed in detail)

Simplified models: DM + few other particles → few defining parameters

WIMPs

di-jet and dilepton final states

Phys. Lett. B 796 (2019) 68

Observed limit on fiducial $\sigma \times BR$ ranges from 3.6 (13.1) fb at 250 GeV to about 0.014 (0.018) fb at 6 TeV for the zero (10%) relative width signal in the combined dilepton channel.

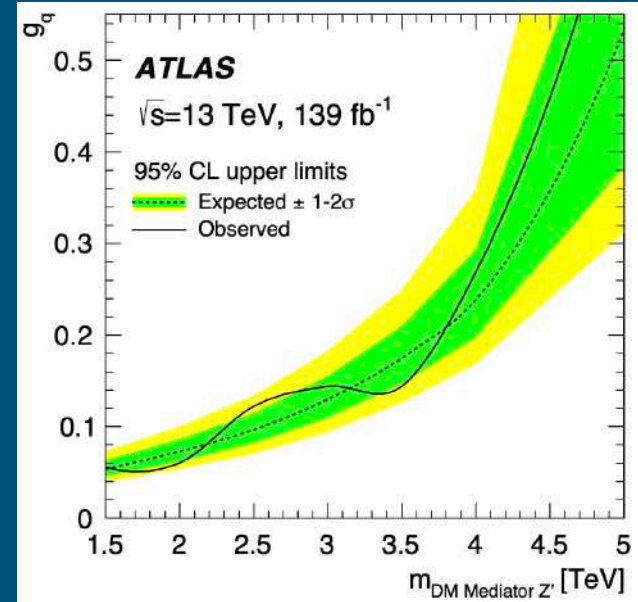

JHEP 11 (2020) 05

$$\frac{d\sigma}{dm_{\ell\ell}} = \frac{d\sigma_{\text{DY}}}{dm_{\ell\ell}} - \eta_{ij} \frac{F_1}{\Lambda^2} + \frac{F_C}{\Lambda^4}$$

Non-resonant dilepton: Interference between the DY and CI processes can be constructive or destructive depending on the sign of η_{ij}

JHEP 03 (2020) 145

Resonant dijet search: The 95% CL upper limits are set on the universal quark coupling g_q as a function of the Z' mass

What are the ingredients for a simplified/collider-friendly DM model?

Basic Ingredients:

- Generic signatures
- Evades constraints
- Manageable no. of parameters
- Promising dark matter candidate
 - ability to satisfy relic density

Spices/garnishes:

- Wide range of possible signatures
- Interesting phenomenology
- Potential synergies
 - decays: prompt vs LLP vs invisible
 - resonant vs non-resonant production
 - complementarity with direct/indirect detection

2HDM+a

LHC DMWG report: [ArXiv 1810.09420](https://arxiv.org/abs/1810.09420)

2HDM containing an additional pseudoscalar boson which mediates the interactions between the visible and the dark sector

- gauge invariant & renormalisable extension of simplified pseudoscalar model
- DM candidate: singlet under SM gauge group, usually a Dirac fermion
- CP-odd mediator [pseudo scalar to bypass constraints from DD]

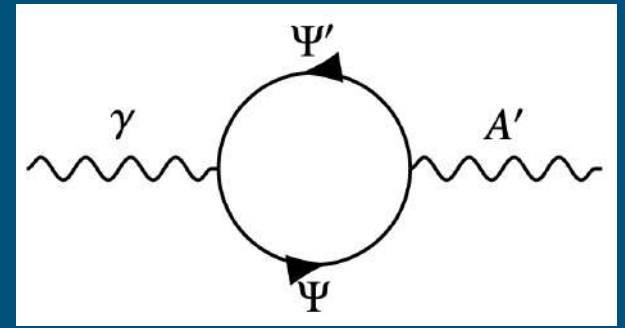

FREE PARAMETERS OF THE THEORY:

- * masses of the heavy Higgs ($m_A = m_H = m_{H^\pm}$)
- * mass of pseudo-scalar mediator, m_a
- * mass of DM particle, m_χ
- * sine of mixing angle b/w CP-odd states a & A , $\sin\theta$
- * VEV ratio, $\tan\beta$

ATLAS 2HDM+a summary paper
<https://arxiv.org/abs/2306.00641>

Dark-photons

Vector Portal: Add a $U(1)'$ whose massive “dark” gauge boson mixes kinetically with SM photon

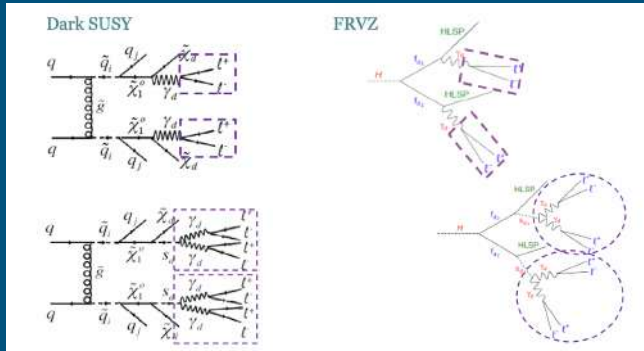

Higgs Portal: Add dark scalar singlet that spontaneously breaks $U(1)'$ and mixes with SM Higgs

Hidden Valley: sector of dark particles, interacting amongst themselves

- Lowest particle in Valley forced to decay to SM due to mass gap or symmetry
- “Portal” coupling both to SM and HV operators, can be A'

Benchmark models for limit setting

Dark SUSY:

Neutralino \rightarrow dark photon and susy DM, and dark photon decaying to pair of leptons

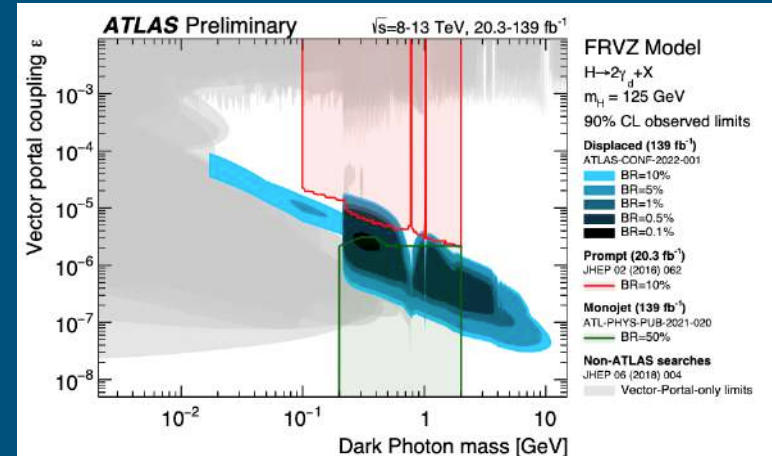

Neutralino \rightarrow susy DM, and pair of dark photons decaying to pair of leptons

Falkowsky-Ruderman-Volansky-Zupan model:

Pair of dark fermions produced in the Higgs boson decay

dark fermion decays in turn to a dark photon + a lighter dark fermion assumed to be the Hidden Lightest Stable Particle (HLSP).

dark photon (vector mediator) mixes kinetically with the SM photon and decays to leptons or light hadrons.

[ATL-PHYS-PUB-2022-007](#)

Exclusions also available for lepton+jets in high mass regions from ATLAS, CMS and LHCb dedicated searches.

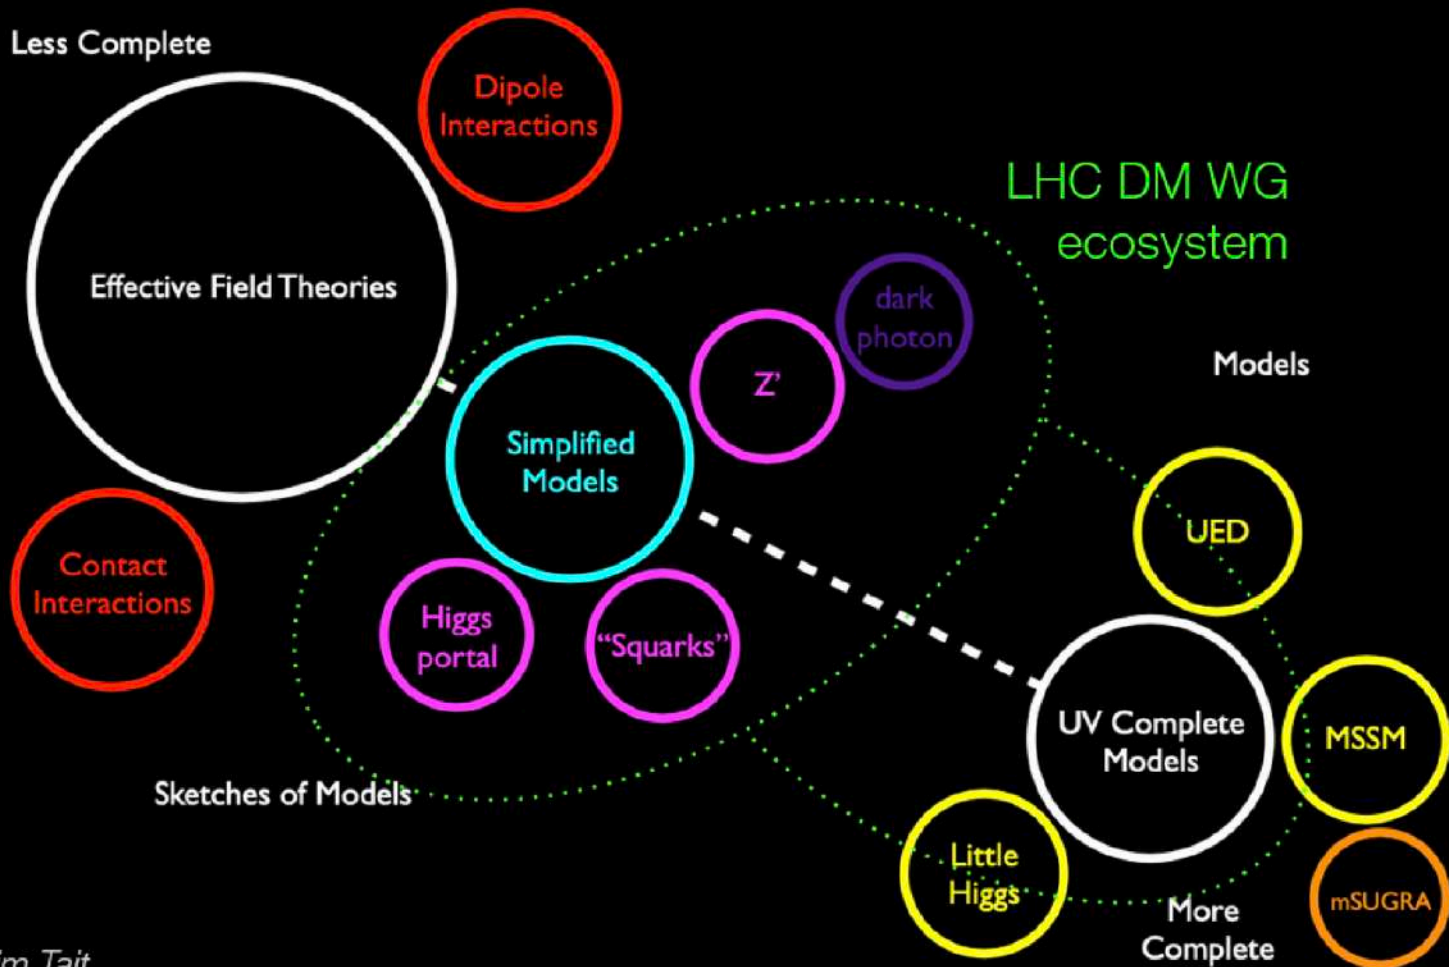

Figure: Tim Tait

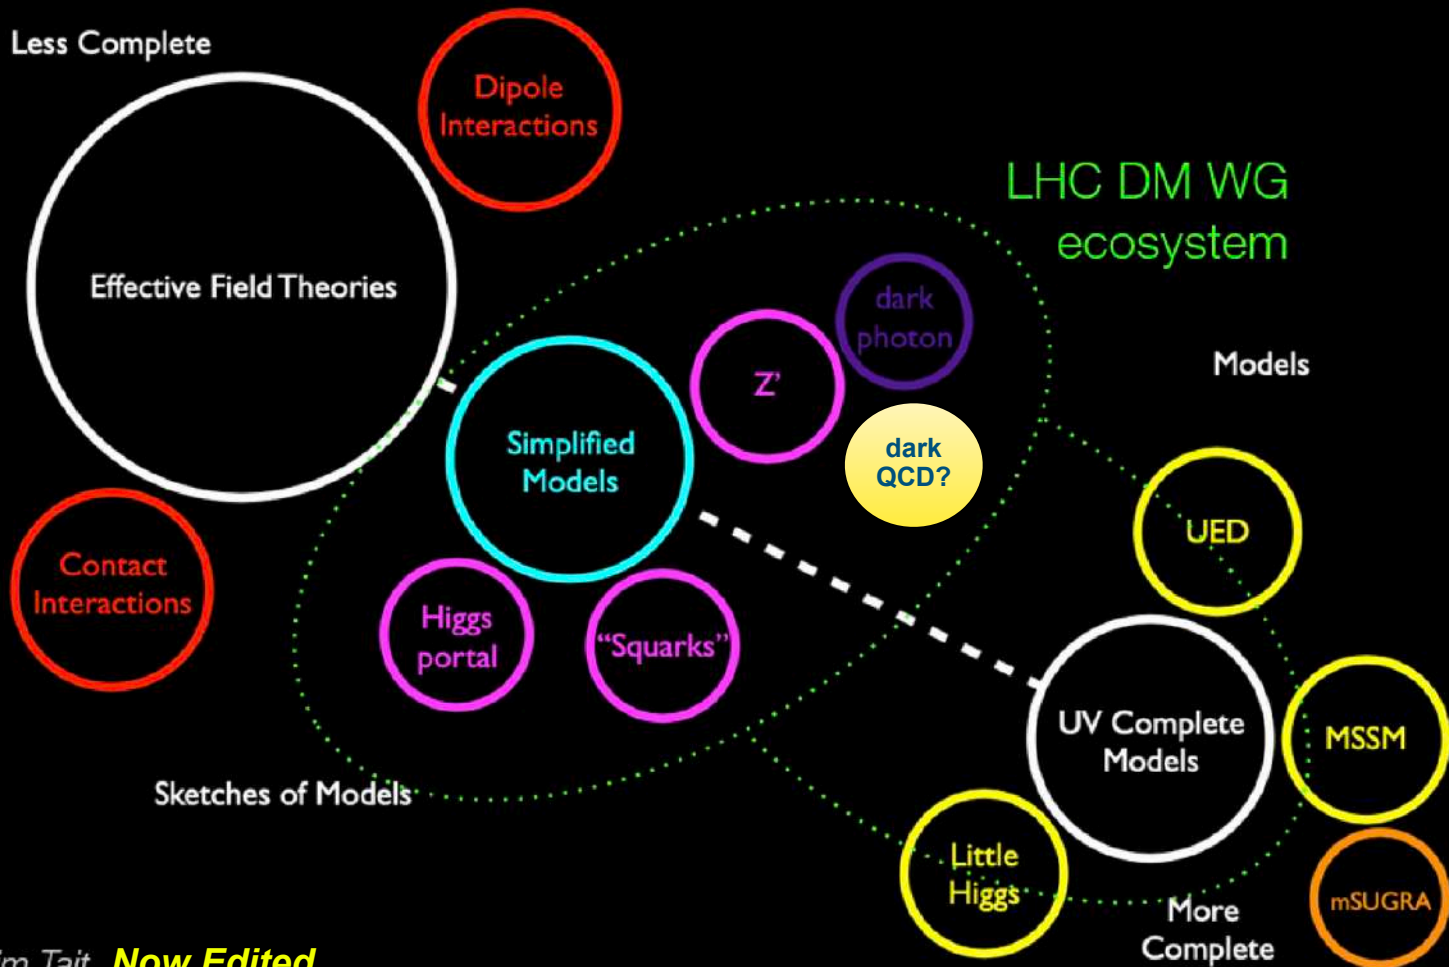

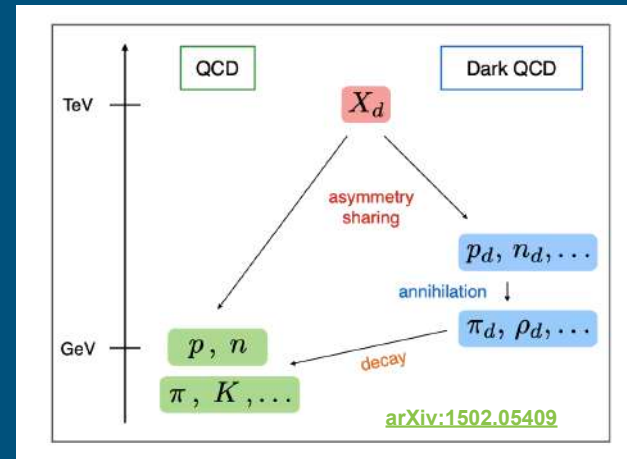

Figure: Tim Tait **Now Edited**

Dark QCD matters!

Hidden Valley may provide cosmologically required DM. No attempt to construct a specific model \rightarrow set up reasonably generic framework for simulating variety of experimental signatures.

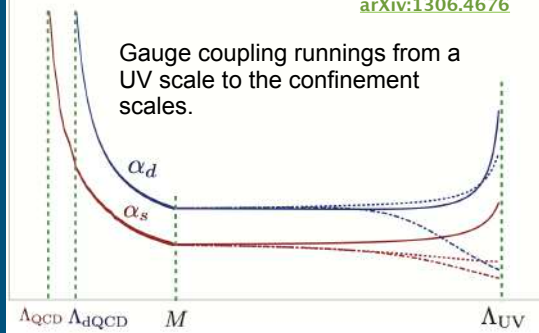

Different dark quark flavours combine to form π_d^+ , π_d^- , π_d^0 , and ρ_d^+ , ρ_d^- , ρ_d^0 (assumed to be produced thrice as much as pions)

- Neutral dark mesons can be unstable and (promptly) decays to SM quarks: more likely to decay to b pairs due to need for a mass insertion, to make the angular momentum conservation work out
- Other mesons can be (collider-)stable \rightarrow invisible

[arXiv:1306.4676](https://arxiv.org/abs/1306.4676)

Gauge coupling runnings from a UV scale to the confinement scales.

Baryon and DM asymmetries shared via a mediator $X_d \rightarrow$ asymmetry in stable dark baryons.

The symmetric relic density annihilated into dark pions \rightarrow decay into SM particles.

Correct DM relic density obtained when dark baryon masses are in the 10 GeV range.

Different UV boundary gauge couplings can lead to the same perturbative IR fixed points.

The final state signatures...

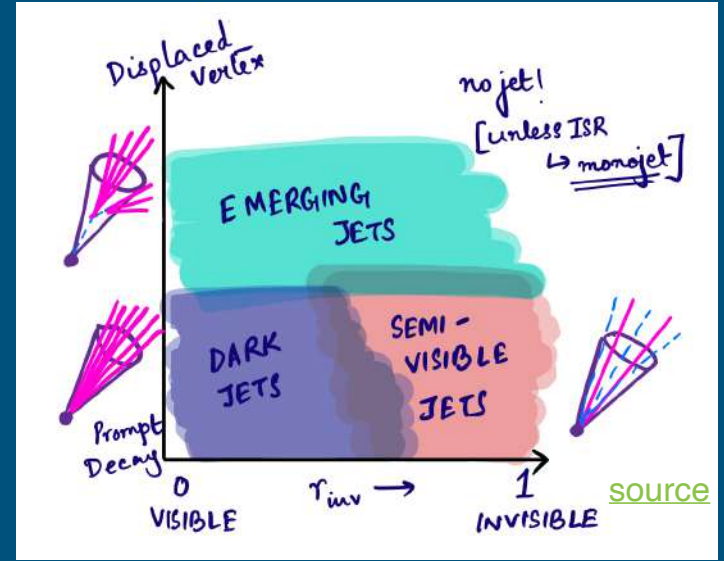

Dark hadrons decaying promptly in a QCD-like fashion,

- fully, or
- partially back to the visible sector

Dark hadrons undergoing displaced decays in a QCD-like fashion

Each signature has a distinctive feature:

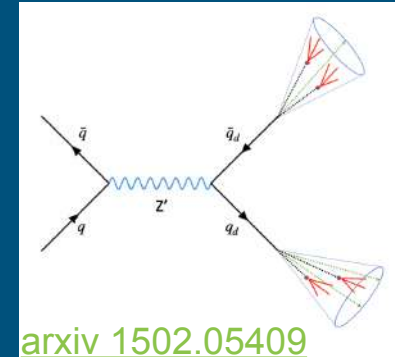

- > Dark jets: unique substructure
- > Emerging jets: displaced objects
- > Semi-visible jets: substantial missing energy

Showering using Pythia hidden valley module: at best a guesstimate!

$$R_{inv} = \frac{\text{\#stable dark hadrons}}{\text{\#all dark hadrons}}$$

ATLAS semi-visible jet t-channel

Lagrangian containing the interaction and kinetic terms:

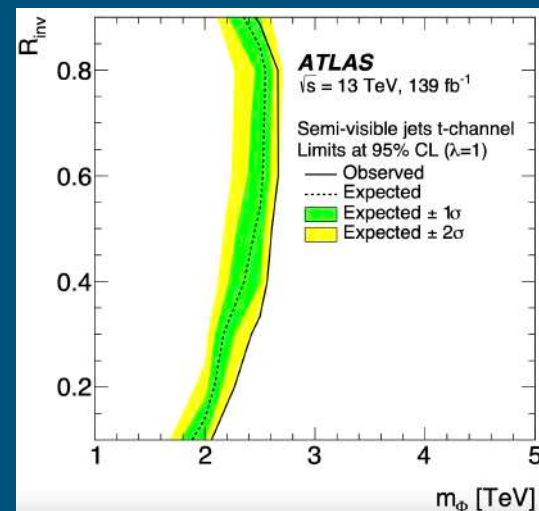

$$\mathcal{L}_{\text{dark}} \supset -\frac{1}{2} \text{tr} G_{\mu\nu}^d G^{d\mu\nu} - \bar{\chi}_a (i\not{D} - M_{d,a}) \chi_a$$

Dark sector \rightarrow SU(2) gauge theory with coupling

$$\alpha_d = \frac{g_d^2}{4\pi}, \text{ containing two fermionic states.}$$

Assuming minimal flavour-violation, light-flavour production channels dominate.

- Assuming a coupling strength of unity between the mediator, a Standard Model quark and a dark quark, mediator masses up to 2.7 TeV can be excluded.
- For mediator mass of 2.5 TeV or higher can also express the limits in terms of the $q\text{-}q_d\text{-}\phi$ vertex coupling strength λ , as $X_S \sim \lambda^4$

[Phys. Lett. B 848 \(2024\) 138324](#)

ATLAS dark jet resonances

4 different benchmark models (A, B, C, D)

Model	n_f	Λ_d (GeV)	$\tilde{m}_{q'}$ (GeV)	m_{π_d} (GeV)	m_{ρ_d} (GeV)	π_d decay mode
A	2	15	20	10	50	$\pi_d \rightarrow c\bar{c}$
B	6	2	2	2	4.67	$\pi_d \rightarrow s\bar{s}$
C	2	15	20	10	50	$\pi_d \rightarrow \gamma'\gamma'$ with $m_{\gamma'} = 4.0$ GeV
D	6	2	2	2	4.67	$\pi_d \rightarrow \gamma'\gamma'$ with $m_{\gamma'} = 0.7$ GeV

JHEP 02 (2024) 128

Exclusion depends on the model, can reach 3-3.5 TeV for which usual $Z' \rightarrow q\bar{q}$ searches can't say much

Dark mesons search

For $\eta (= \frac{m_{\pi_d}}{m_{\rho_d}}) < 0.5$, ρ_d decay to π_d pairs, resulting in $t\bar{t}b$ and $t\bar{t}b\bar{b}$ signatures (in all hadronic decay mode)

[ATLAS-CONF-2023-021](#)

For $\eta = 0.35$, $m_{\pi_d} < 434$ GeV excluded,
 For $\eta = 0.25$, 280 GeV $< m_{\pi_d} < 522$ GeV excluded.

The land of strong dark sector... and LLPs

Invisible component in semi-visible jets are also LLPs but just with very long lifetimes:

1. Assign a very long (but not infinite) lifetime to the original "missing" components.

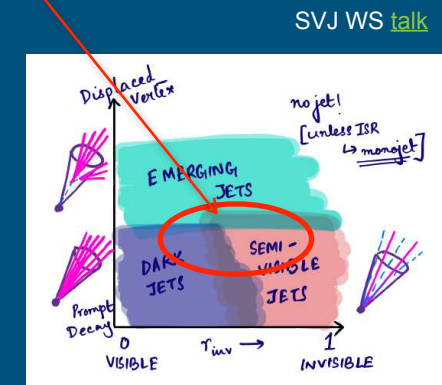

2. Assign a very short but finite lifetime to the original "prompt" components.

3. Add a third component (r_{LLP}) with an arbitrary lifetime

Higgs exotic decays + "prompt" components become LLPs

ABSTRACT

This report summarises the talks and discussions that took place over the course of the MITP Youngst@rs Colours in Darkness workshop 2023. All talks can be found at this URL: <https://indico.mitp.uni-mainz.de/event/377/>.

1 Introduction

In recent years, there has been an increase in the number of search programmes exploring the possibility of a “dark sector” beyond the Standard Model (BSM) using LHC data. To date, dark matter (DM) searches at the Large Hadron Collider (LHC) have usually focused on WIMPs (Weakly Interacting Massive Particles), but since the standard signatures have found no compelling evidence, several recent phenomenology papers have explored the possibility of accessing the dark sector with unique collider topologies. If dark mesons exist, their evolution and hadronization procedure are currently little constrained. They could

*sukanya.sinha@cern.ch

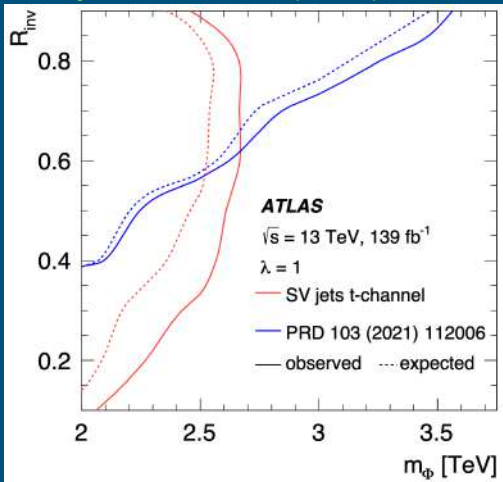

Potential for reinterpretation

DM Complementarity going forward?

[Inspired by Snowmass Community slides [link](#)]

Multiple observations, experiments and coherent theories are needed for DM discovery

- Observations motivating DM arise from astrophysics & cosmic probes
- Theoretical frameworks are crucial to put different observations into context
- **Direct Detection** → can discover DM with cosmological origin
- **Indirect Detection** → can probe decays of cosmological DM into SM particles
- **Colliders / accelerators** → can produce DM and probe its dark interactions

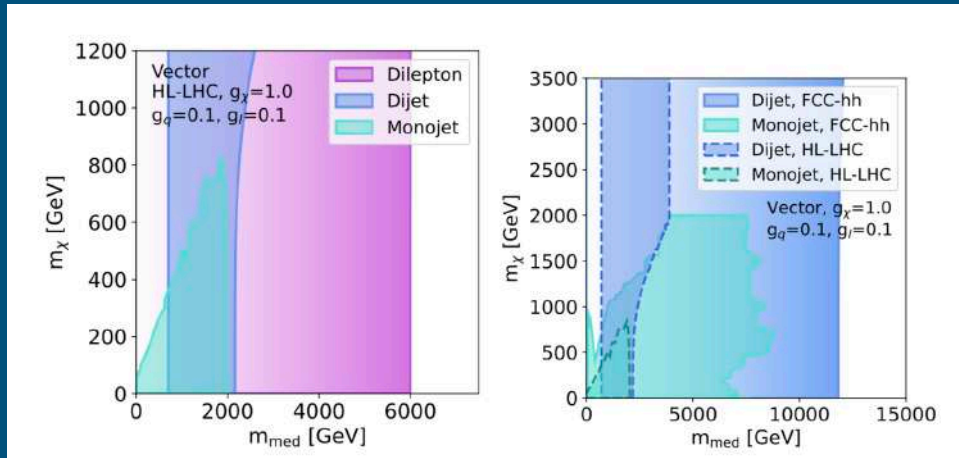

Dark matter mediated by BSM particles

At collider energy scales, we can access the BSM particles that can mediate the SM-DM interactions

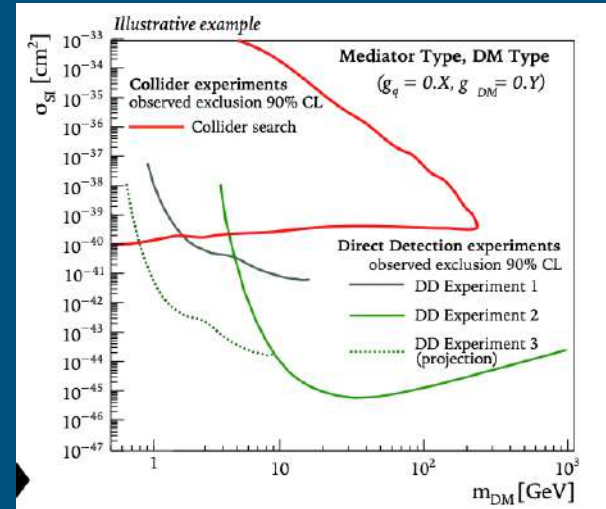

- Mediator can decay into DM → points to an excess in missing energy
- Mediator can also decay into SM particles → accessible using resonance searches

Overlaying results from collider simplified models searches to DD results in DM-nucleon plane:

Perfect region to discover DM would be where both colliders and direct detection have coverage
→ helps to determine both cosmological origin of discoveries as well as nature of interaction

Example scenarios for reach of future colliders for vector mediator resonances

Potential common sketch
(lines should be made more realistic)

Extended dark sectors and dark showers

Dark QCD scenarios predict dark matter as a bound state originating due to confinement

- Early collider results exist
- First steps towards consistent collider analysis taken during Snowmass ([Dark showers project and meetings](#))
- Overlap between colliders and direct detection needs more studies
- Excellent opportunity to exploit synergy with accelerator searches
- Some understanding via lattice QCD calculations for properties of $SU(N)$ theories exists

HV sector π abundance in m - ϵ plane [arXiv:1801.05805](#)

Contours are regions where π abundance matches DM relic density

Squeeze-out: 2103.09827

More details in F. Kahlhoefer's [talk](#)

Light-ish dark matter at colliders

Some models of light dark matter (dark photon/dark Higgs) require new high-mass particles to be theoretically self-consistent

By using the same benchmarks between colliders and accelerator experiments, colliders can discover directly the high-mass particles, complementing light DM discoveries at accelerator experiments

Conclusions

Sector

- Several avenues of dark sector open for exploration
- General idea evolving around the need of more signature based searches
- Confining dark sectors provide a very rich & interesting phenomenology, despite being based on models with only a few ingredients and parameters (quoting: 1905.08810)
- Discussions ongoing between experimentalists and theorists in different platforms ([Snowmass Dark Showers](#) working group, LHC DMWG)
- Steps to enhance complementarity
 - By developing a search program spanning across energy scales, as unbiased as possible
 - By extending searches for DM particles with the highest possible Lab-accessible masses
 - By constraining properties of SM - DM mediators and/or portal interactions

A LECTURE AT
WHATSA MATTER U

General direction of DM collider searches in 20s and 30s

If we want to capture Dark sector in a simplified model approach,
- We need to be careful not to destroy the beauty of the SM !

Higgs portal dark matter scenario provides very interesting interference effects on the LHC analysis and it will be more interesting as LHC go to the HL region.

- Hints of $\gamma\gamma$ at 95GeV , 152GeV , 680GeV
- $\gamma\gamma$ at 95GeV supported by $\tau\tau$ and $b\bar{b}$ (LEP) \longrightarrow Many papers!
- $\gamma\gamma, ZZ$ hints at 680GeV
- $b\bar{b}\gamma\gamma$ hint at 680GeV , with $\gamma\gamma$ compatible with 95GeV

All pointing towards extended scalar sector! 2hdm+S/a

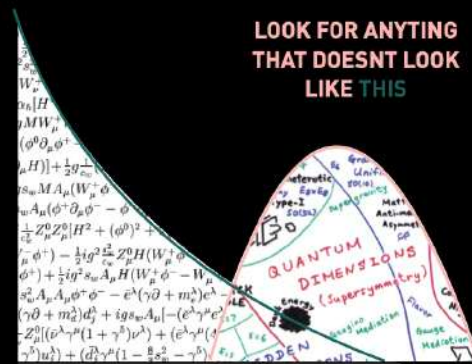

Light dark photons are theoretically well-motivated particles, and they arise in many BSM theories.

They can be copiously produced at accelerator experiments.

Plethora of signatures can be searched for. Interesting complementarity between visible, invisible, and semi-visible signatures.

Complementarity between LHC searches (Higgs exotic decays!) and searches at high-intensity experiments.

LEARN THIS FROM DATA

- Run-2 simplified models constrained \rightarrow update
- Improved tools for coupling variation aid presentation.
- Complementarity with detection exp., light DM.
- Codify $h \rightarrow$ invisible completions.
- General interest in looking beyond the assumptions/simplifications of the Run-2 WP benchmarks

2HDM+a of Type I is not yet explored \rightarrow Leads to promising new signatures

Goal: New benchmarks of uncovered final states \rightarrow New analyses with Run3 data

New decay channels: $A \rightarrow H(bb)$, $A \rightarrow ZH(aZ)$
 $H \rightarrow A(tt)$, $H \rightarrow H' W$

$b\bar{b} + E_{\text{miss}}$ and $l\bar{l}b\bar{b}$ expand exclusion to masses below the SM Higgs mass

Why MSSM DM?

Has been in limelight for a long time

Has been under test at multiple experiments

No hints yet

A relatively smaller allowed parameter space

How does this conventional dark matter candidate stand against the recent experimental results?

Are there any gaps which can be focal points for Run-3 of LHC?

The current experiments, especially the recent results from the electroweakino searches at the LHC and the LZ dark matter DD experiment have squeezed the allowed parameter space to regions which can either be

- regions of heavy higgsinos very close to being probed by few days of LZ data
- contain very low mass higgsinos which can be targeted at the Run-3 of LHC with dedicated analyses to be sensitive in this narrow gap.

- Foundation models getting more and more attention in HEP
- Promising concept to uncover the dark sector:
 - Unsupervised pre-training task: this could be done on data directly
 - Small dataset can be sufficient to get good performance

Novel collider signatures in the type-1 2HDM+a model

2HDM+a: a thriving playground for LLPs?

[Hunting LLP@LHC](#)
[arxiv 2302.02735](#)

LLP signatures are possible in 2HDM+a if:

- $\sin\theta \approx 0$
- DM candidate is kinematically inaccessible or decoupled

"a" \rightarrow LLP candidate:

- * pair produced by SM/BSM CP-even Higgs, depending on it's mass
- * if strong suppression of g_a in $\sin\theta \rightarrow 0$ limit, only spin0 Φ can decay to pair of "a"

2HDM+a: a thriving playground for LLPs?

[Hunting LLP@LHC](#)
[arxiv 2302.02735](#)

LLP signatures are possible in 2HDM+a if:

- $\sin\theta \approx 0$
- DM candidate is kinematically inaccessible or decoupled

"a" \rightarrow LLP candidate:

- * pair produced by SM/BSM CP-even Higgs, depending on it's mass
- * if strong suppression of g_a in $\sin\theta \rightarrow 0$ limit, only spin0 Φ can decay to pair of "a"

Example benchmarks [λ_{P1} and λ_{P2} are quartic couplings for 2 pseudo scalars]

$$\text{I: } \{\lambda_{P1}, \lambda_{P2}, m_\chi\} = \{2 \cdot 10^{-3}, 2 \cdot 10^{-3}, 170 \text{ GeV}\}$$

$\sin\theta$ and m_a are free parameters:

$m_a < m_h/2 \rightarrow$ LLP can be pair produced in the decay of 125 GeV Higgs

Excluded proper decay length, $c\tau$ ranges from 0.08 - 59 m

2HDM+a: a thriving playground for LLPs? [Hunting LLP@LHC](#)

[arxiv 2302.02735](#)

LLP signatures are possible in 2HDM+a if:

- $\sin\theta \approx 0$
- DM candidate is kinematically inaccessible or decoupled

"a" \rightarrow LLP candidate:

- * pair produced by SM/BSM CP-even Higgs, depending on it's mass
- * if strong suppression of g_a in $\sin\theta \rightarrow 0$ limit, only spin0 Φ can decay to pair of "a"

Example benchmarks [λ_{P1} and λ_{P2} are quartic couplings for 2 pseudo scalars]

II: $\{\lambda_{P1}, \lambda_{P2}, m_\chi\} = \{3, 0, 770 \text{ GeV}\}$

$\sin\theta$, m_H and m_a are free parameters:

$m_a > m_h/2$ & $m_a < m_H/2 \rightarrow$ LLP can be pair produced in the decay of heavy Higgs, followed by displaced decays of "a" to pair of SM fermions or gluons

Excluded ct ranges from 0.04 - 53 m

LLP reinterpretation of existing ATLAS searches

HTop $H \rightarrow 2a \rightarrow 4b$ 2015+2016 (HIGG-2017-05) has a Long-Lived particle reinterpretation!

ATL-COM-PHYS-2018-099

Search for $H \rightarrow SS \rightarrow 4b$ in VH topology associated Higgs boson production:

Signal model: $M_{\text{GS}} \text{ SM} + \text{dark vector} + \text{dark Higgs}$, recommended by LHC HiggsXS WG

* Samples produced with 0.1, 1 and 10mm mean Lifetimes

95% CL ZH channels, based on the cut-based analysis strategy

Possible dark photon production and decay modes

- Bremsstrahlung \rightarrow incoming electron scatters off a nuclei target (Z) and emits dark photon, i.e., $e-Z \rightarrow e-Z\gamma_d$
- Annihilation \rightarrow electron-positron pair annihilates into a photon and a dark photon, i.e., $e-e^+ \rightarrow \gamma\gamma_d$
- Drell-Yan \rightarrow $q\bar{q}$ pair annihilates into a dark photon, which consequently decays into a lepton pair or hadrons, i.e., $q\bar{q} \rightarrow \gamma_d \rightarrow l^+l^-$ or h^+h^-

Dark photon decay branching fractions for the visible dark photon scenario for $m_\gamma < 2$ GeV.

Other signatures of dark QCD with potential LLP

Invisible component in semi-visible jets are also LLPs but just with very long lifetimes:

1. Assign a very long (but not infinite) lifetime to the original "missing" components.

2. Assign a very short but finite lifetime to the original "prompt" components.

3. Add a third component (r_{LLP}) with an arbitrary lifetime

Higgs exotic decays + "prompt" components become LLPs
