Outline

- PCNC Higgs Couplings to Leptons
- FCNC Higgs Couplings to quarks
- OP Violation in FCNC Higgs Decays

Flavor Mixing in the Higgs Sector

Motivation

Scenario 1: Several sources of EW symmetry breaking

• If fermion masses have more than one origin, they do not need to be aligned with the Yukawa couplings

Simplest example: Type III 2-Higgs-Doublet Model

$$\mathcal{L}_{Y} \supset -Y^{(1)}_{ij} ar{L}^{i} e^{j}_{R} H^{(1)} - Y^{(2)}_{ij} ar{L}^{i} e^{j}_{R} H^{(2)} + h.c.$$

 $\longrightarrow -m_i \bar{e}_L^i e_R^i - Y_{ij}^{\text{eff}} \bar{e}_L^j e_R^j h + \text{couplings to heavier Higgs bosons} + h.c.$

(h = Lightest neutral Higgs boson, $m_h \sim 125 \text{ GeV}$)

Assume heavy Higgs bosons are decoupled.

see for instance Davidson Greiner, arXiv:1001.0434

Similar couplings for quarks

Motivation (2)

Scenario 2: Extra Higgs couplings

Assume existence of heavy new particles, which induce effective operators of the form

$$\Delta \mathcal{L}_{Y} = -\frac{\lambda'_{ij}}{\Lambda^{2}} (\bar{e}^{j}_{L} e^{j}_{R}) H(H^{\dagger} H) + h.c. + \cdots,$$

 \rightarrow after EWSB, new (but misaligned) contributions to mass matrices and Yukawa couplings

Effective Lagrangian is again

$$\mathcal{L}_{Y} \supset -m_{i} \bar{e}_{L}^{i} e_{R}^{i} - Y_{ij}^{\text{eff}} \bar{e}_{L}^{i} e_{R}^{j} h + h.c.$$

see for instance Giudice Lebedev, arXiv:0804.1753

Effective Yukawa Lagrangfian

Effective Yukawa Lagrangian

$$\mathcal{L}_{Y} = -m_{i}\bar{f}_{L}^{i}f_{R}^{i} - Y_{ij}^{a}(\bar{f}_{L}^{i}f_{R}^{j})h^{a} + h.c. + \cdots$$

- LHC limits on $h \rightarrow \mu \tau$, $h \rightarrow e \tau$, $t \rightarrow ch$, $t \rightarrow uh$
- Strategies for future LHC searches
- Possibility of Flavor + CP violation

FCNC Higgs Couplings to Leptons

Low-energy constraints on LFV in the Higgs sector

Joachim Kopp

Flavor and CP Violation in Higgs Decays

Constraints on $h \rightarrow \mu e$

Assumption here:

Diagonal Yukawa couplings unchanged from their SM values.

Harnik JK Zupan, arXiv:1209.1397 see also Blankenburg Ellis Isidori, arXiv:1202.5704 Goudelis Lebedev Park, arXiv:1111.1715

Constraints on $h \rightarrow \tau \mu$ and $h \rightarrow \tau e$

Substantial flavor violation ($BR(h \rightarrow \tau \mu, \tau e) \sim 0.01$) perfectly viable.

Assumption here:

Diagonal Yukawa couplings unchanged from their SM values.

Harnik JK Zupan, arXiv:1209.1397 see also: Blankenburg Ellis Isidori, arXiv:1202.5704 Goudelis Lebedev Park, arXiv:1111.1715 Davidson Greiner, arXiv:1001.0434

$\pmb{h} \rightarrow \tau \mu$ and $\pmb{h} \rightarrow \tau \pmb{e}$ at the LHC

Basic idea:

- $h \rightarrow \tau \ell$ has the same final state as $h \rightarrow \tau \tau_{\ell}$ (but is enhanced by $1/BR(\tau \rightarrow \ell)$)
- Recast $h \rightarrow \tau \tau$ search here: ATLAS, arXiv:1206.5971
- Consider only 2-lepton final states
- Use VBF cuts (much lower BG than gg fusion)

see however Davidson Verdier, arXiv:1211.1248

$h \rightarrow \tau \mu$ and $h \rightarrow \tau e$ at the LHC

LHC constraints on $h \rightarrow \tau \mu$ and $h \rightarrow \tau e$

Harnik JK Zupan, arXiv:1209.1397

LHC constraints on $h \rightarrow \tau \mu$ and $h \rightarrow \tau e$

Harnik JK Zupan, arXiv:1209.1397

Strategy for a dedicated $h \rightarrow \tau \mu$ and $h \rightarrow \tau e$ search

Possible improvements

- Different invariant mass formula
 - Avoids smearing of signal
 - Shifts $Z \rightarrow \tau \tau$ peak to lower invariant mass
- Include hadronic τ's
- Optimized cuts
 - Use higher lepton p_T in $h \rightarrow \mu \tau$ compared to $h \rightarrow \tau \tau$
 - Use $\Delta \phi$ and M_T cuts
 - Allows inclusion of *gg* fusion events

Harnik JK Zupan, arXiv:1209.1397 Davidson Verdier, arXiv:arXiv:1211.1248

ATLAS arXiv:1403.6293

Future directions

Some ideas for future improvements

- Include *tuh* couplings \rightarrow leads to factor 1.5 improvement
- Optimize cuts
- Other final states → this talk
- η_h as discriminator between *tuh* and *tch* couplings \rightarrow this talk

- Analysis 1: $pp \rightarrow \overline{t}(t \rightarrow hj) \rightarrow$ hadrons
 - ► Tagging SM $t \rightarrow Wb$ decays: HEPTopTagger

Plehn Salam Spannowsky Takeuchi Zerwas, arXiv:0910.5472, 1006.2833 Tagging FCNC $t \rightarrow hq$ decays: Modified HEPTopTagger

- ► Tagging FCNC $t \rightarrow hq$ decays: Modified HEPTopTagger with adapted kinematic cuts
- Require b tags in likely b subjets

- Analysis 1: $pp \rightarrow \overline{t}(t \rightarrow hj) \rightarrow$ hadrons
- Analysis 2: $pp \rightarrow th \rightarrow hadrons$ (single top + Higgs productions)
 - Tagging SM $t \rightarrow Wb$ decays: HEPTopTagger

Plehn Salam Spannowsky Takeuchi Zerwas, arXiv:0910.5472, 1006.2833

- Higgs tagging: Mass drop tagger
 - Butterworth Davison Rubin Salam 0802.2470; Cacciari Salam Soyez 1111.6097
- Require b tags in likely b subjets
- Cuts on m_H (reconstructed Higgs mass) and $|\eta_h|$ (reconstructed Higgs rapidity)

Comparison of current and projected future limits

Fully hadronic	< 0.12	< 0.0036	< 0.13	< 0.0048

Discriminating between tuh and tch couplings

In $ug \rightarrow th$, interaction products tend to be boosted in the direction of the *u* quark.

(Valence quarks carry larger fraction of proton momentum.)

Moreover: In center of mass frame, Higgs boson is emitted preferentially in the direction of the up quark

(angular momentum conservation + chirality flip in *tuh* Yukawa vertex.)

Result (parton level):

Discriminating between tuh and tch couplings

In $ug \rightarrow th$, interaction products tend to be boosted in the direction of the *u* quark. (Valence quarks carry larger fraction of proton momentum.)

Moreover: In center of mass frame, Higgs boson is emitted preferentially

in the direction of the up quark

(angular momentum conservation + chirality flip in *tuh* Yukawa vertex.)

Parton level vs. analysis level:

Discriminating between *tuh* and *tch* couplings (2)

Conclusion: Rapidity $\eta_{\ell\ell}$ of dilepton system from $h \to WW^* \to \ell\ell\nu\nu$ is a good discriminator between *tuh* and *tch* couplings.

Moreover: Final state lepton charges as an additional discriminant.

Result for multilepton search:

For a 5σ discovery, discrimination between *tuh* and *tch* is possible at 2σ .

CP Violation in FCNC Higgs Decays

CP violation in FCNC Higgs decays

Basic idea:

- Interference of tree and loop diagrams leads to CP violation
- Weak phase from non-standard Yukawa couplings
- Strong phase from loop function (since m_ℓ < m_h/2)

JK Nardecchia, arXiv:1406.5303

Example: A Two Higgs-Doublet Model

$$\mathcal{L} \supset -\frac{\sqrt{2}m_i}{v}\delta_{ij}\,\overline{L}_L^i \ell_R^j \Phi_1 - \sqrt{2}Y_{ij}\,\overline{L}_L^i \ell_R^j \Phi_2 + h.c.\,,$$

In the physical basis:

$$\mathcal{L} = -m_i \bar{\ell}_L^i \ell_R^i - \sum_{r=1,2,3} Y_{ij}^{h_r} \bar{\ell}_L^i \ell_R^j h_r + h.c. \qquad (r = 1,2,3)$$

with

$$Y_{ij}^{h_r} = \frac{m_i \delta_{ij}}{v} O_{1r} + Y_{ij} O_{2r} + i Y_{ij} O_{3r},$$

O = SO(3) (real 3 × 3) rotation matrix

Example: A Two Higgs-Doublet Model

$$\mathcal{L} \supset -\frac{\sqrt{2}m_i}{v}\delta_{ij}\,\overline{L}_L^i \ell_R^j \Phi_1 - \sqrt{2}Y_{ij}\,\overline{L}_L^i \ell_R^j \Phi_2 + h.c.\,,$$

Result:

$$\begin{split} \mathcal{A}_{CP}^{\mu\tau} &= \sum_{\alpha=2,3} \frac{1}{4\pi} \frac{|Y_{\tau\mu}|^2 - |Y_{\mu\tau}|^2}{|Y_{\tau\mu}|^2 + |Y_{\mu\tau}|^2} \bigg(|Y_{\mu\tau}|^2 + |Y_{\tau\mu}|^2 + |Y_{\tau\tau}|^2 \bigg) \\ &\times \mathcal{R}_{\alpha} \times \bigg[g\bigg(\frac{m_h^2}{m_{h_{\alpha}}^2} \bigg) + \frac{m_h^2}{m_h^2 - m_{h_{\alpha}}^2} \bigg] \end{split}$$

with

$$R_{\alpha} = \frac{(O_{3\alpha}O_{21} - O_{2\alpha}O_{31})(O_{2\alpha}O_{21} + O_{3\alpha}O_{31})}{O_{21}^2 + O_{31}^2}$$

... suppressed only by loop factor

JK Nardecchia, arXiv:1406.5303

Sensitivity to CPV in FCNC Higgs decays @ HL-LHC

- Best discovery potential in small Higgs mixing regime
- CP violation visible only at high-luminosity LHC
- Would require a detection of $h \rightarrow \tau \mu$ or $h \rightarrow \tau e$ very soon.

JK Nardecchia, arXiv:1406.5303

Summary

Summary

- Flavor-violating Higgs couplings arise in
 - Models with several sources of electroweak symmetry breaking
 - Models with heavy fields coupled to the Higgs
- In the lepton sector:
 - In the µ−e sector: strong constraints from LFV searches
 - In the τe and $\tau \mu$ sectors: strongest constraints from the LHC
 - ▶ If $h \rightarrow \tau \mu$ or $h \rightarrow \tau e$ is discovered soon: Possibility to look for CP violation in the future.
- In the quark sector:
 - Light quarks: strong constraints from meson mixing
 - Top quark: Limits on $t \rightarrow ch$ from multileptons, diphotons
 - Future improvements:
 - * Include anomalous single-t production for tuh couplings
 - Optimized cuts
 - Other final states (fully hadronic is feasible with jet substructure techniques)
 - Use Higgs rapidity η_h and lepton charges as a discriminator between tuh and tch couplings

Thank you!

CMS event selection for multilepton analysis

At least 3 leptons

(electrons, muons, hadronic tau candidates (" τ_h ")

- Standard p_T and η cuts
 - $p_T^{e,\mu} > 10 \text{ GeV}, |\eta^{e,\mu}| < 2.4$
 - $p_T^{ au_h} > 20 \; {
 m GeV}, \, |\eta^{ au_h}| < 2.3$
 - at least one e or µ must be above 20 GeV
- Isolation criteria
- Lepton tracks required to start close to the primary vertex
- Jets are reconstructed with the anti- k_T algorithm; must have $p_T > 30$ GeV, $|\eta| < 2.5$
- Combined secondary vertex algorithm for *b*-tagging

CMS event classification for multilepton analysis

Events are sorted in non-overlapping categories according to

- Number of leptons (3 or \geq 4)
- **∉**_T
- Number of τ_h candidates
- Number of *b*-tagged jets
- Number of OSSF ("opposite sign, same flavor") lepton pairs
- OSSF pairs on/off the Z-resonance

 \rightarrow A very versatile search that is sensitive to many types of new physics

Backgrounds for CMS multilepton analysis

• Z + jets

(two leptons from Z decay, one lepton from misidentified jet or heavy flavor decay)

- SM WZ or ZZ production
- tt
 triangle production
 (two leptons from W decay, one lepton from semileptonic b decay)
- Internal conversion of photons
- Rare processes (triple boson production, $t\bar{t} + V$ production)

Relative importance of backgrounds varies significantly between event categories.

So do systematic uncertainties.

Results: 3-lepton categories

The most sensitive channels in the $t \rightarrow cH$ search

Relevant are mostly the two lowest $\not\!\!\!E_T$ bins.

$t \rightarrow cH$: CMS Constraints

Higgs D	ecay Mode	obs	exp	1σ range
$h \to WW^*$	(BR = 23.1 %)	1.58 %	1.57 %	(1.02-2.22)%
h ightarrow au au	$h \rightarrow \tau \tau$ (BR = 6.15 %)		4.99 %	(3.53–7.74)%
$h \to ZZ^*$	(BR = 2.89 %)	5.31 %	4.11 %	(2.85–6.45)%
con	1.28 %	1.17 %	(0.85–1.73)%	

 $BR(t \rightarrow cH) < 0.013$

 $\sqrt{|y_{tc}|^2 + |y_{ct}|^2} < 0.21$

Diphoton + lepton — Backgrounds

Background from sideband fit at $m_{\gamma\gamma}$ < 120 GeV and $m_{\gamma\gamma}$ > 130 GeV.

CMS-PAS-HIG-13-034, recasting CMS-PAS-HIG-13-025

$t \rightarrow cH$ search in the diphoton + lepton channel

Requirements:

- One isolated lepton ($p_T > 10 \text{ GeV}, |\eta| < 2.4$)
- Two photons (p_{T1} > 40 GeV, p_{T1} > 20 GeV, $|\eta|$ < 2.5)
- 120 GeV $< m_{\gamma\gamma} <$ 130 GeV

Events are classified according to

- **∉**_T
- b-tagged jets
- τ_h candidates

CMS-PAS-HIG-13-034, recasting CMS-PAS-HIG-13-025

Diphoton + lepton — Results

$N_{\tau_{had}}$	$E_{\rm T}^{\rm miss}$ [GeV]	N _{b-jets}	data	background	signal	efficiency [10 ⁻⁵]
0	50-100	≥ 1	1	2.3 ± 1.2	2.88 ± 0.39	3.1 ± 0.4
0	30-50	≥ 1	2	1.1 ± 0.6	2.16 ± 0.30	2.4 ± 0.3
0	0-30	≥ 1	2	2.1 ± 1.1	1.76 ± 0.24	1.9 ± 0.3
0	50-100	0	7	9.5 ± 4.4	2.22 ± 0.31	2.4 ± 0.3
0	> 100	≥ 1	0	0.5 ± 0.4	0.92 ± 0.14	1.0 ± 0.2
0	> 100	0	1	2.2 ± 1.0	0.94 ± 0.17	1.0 ± 0.2
0	30-50	0	29	21 ± 10	1.51 ± 0.22	1.6 ± 0.2
1	30-50	≥ 1	2	2.1 ± 1.2	0.43 ± 0.09	0.5 ± 0.1
1	0-30	≥ 1	6	6.4 ± 3.3	0.48 ± 0.12	0.5 ± 0.1
1	50-100	≥ 1	1	1.5 ± 0.8	0.30 ± 0.08	0.3 ± 0.1

Most sensitive channel has one *b*-jet, medium $\not\!\!\!E_T$, no τ_h .

CMS-PAS-HIG-13-034, recasting CMS-PAS-HIG-13-025

ATLAS $t + (h \rightarrow \gamma \gamma)$ analysis

- Includes diphoton + lepton and diphoton + jets final states
- Requires b-jets
- Imposes criteria on invariant masses $m_{\gamma\gamma j}$, $m_{\ell\nu j}$, m_{jjj}
- Uses $m_{\gamma\gamma}$ as discrimination variable

(slightly worse than CMS combined limit BR($t \rightarrow cH$) < 0.0056, $\sqrt{|y_{tc}|^2 + |y_{ct}|^2} < 0.14$) ATLAS arXiv:1403.6293

Diphoton analysis from ATLAS

- Diphoton + lepton analysis: cuts similar to CMS, but in addition:
 - ▶ Require m_{T,ℓν} > 30 GeV
 - Consider two leading jets (2nd jet replaced by 3rd/4th if 3rd/4th is b-tagged)
 - Require one b-jet
 - ► Define $m_1 = m_{\gamma\gamma j}$ and $m_2 = m_{\ell\nu j}$ such that either m_1 or m_2 (or both) are close to m_t

ATLAS arXiv:1403.6293

Diphoton analysis from ATLAS

- Diphoton + lepton analysis: cuts similar to CMS, but in addition:
- Diphoton + jets analysis ۰
 - Require two photons as before
 - In addition, four jets, at least one b-jet
 - Define $m_1 = m_{\gamma\gamma i}$ and $m_2 = m_{iji}$ such that either m_1 or m_2 (or both) are close to mt

(signal predictions are for $BR(t \rightarrow hu) = 0.01$)

Most sensitive channels have 3 leptons, low H_T , one *b*-jet

• Recast the CMS multilepton search including also $gq \rightarrow th$:

- Result (multileptons): Limit on Yukawa couplings $y_{tu}^2 + y_{ut}^2$ is a factor of 1.5 stronger than limit on $y_{tc}^2 + y_{ct}^2$
- Specifically:

 $\mathsf{BR}(t o hc) < 0.015$ $\mathsf{BR}(t o hu) < 0.010$

Limit on BR($t \rightarrow hu$) is a factor 1.5 better than limit on BR($t \rightarrow hc$).

(Our limits are slightly worse than CMS limits because τ_h channels are omitted.)

• Recast the CMS multilepton search including also $gq \rightarrow th$:

• Result (multileptons): Limit on Yukawa couplings $y_{tu}^2 + y_{ut}^2$ is a factor of 1.5 stronger than limit on $y_{tc}^2 + y_{ct}^2$

Result (diphoton+lepton)

• Recast the CMS multilepton search including also $gq \rightarrow th$:

- Result (multileptons): Limit on Yukawa couplings $y_{tu}^2 + y_{ut}^2$ is a factor of 1.5 stronger than limit on $y_{tc}^2 + y_{ct}^2$
- Result (diphoton+lepton): Limit on Yukawa couplings $y_{tu}^2 + y_{ut}^2$ is a factor of 1.5 stronger than limit on $y_{tc}^2 + y_{ct}^2$
- Specifically:

 $\mathsf{BR}(t
ightarrow hc) < 0.0066$ $\mathsf{BR}(t
ightarrow hu) < 0.0045$

Optimized cuts

Example: recast CMS search for V + H production

CMS-PAS-HIG-12-053 Greljo Kamenik JK, 1404.1278

Cuts:

- Exactly two same-sign light leptons (→ suppress Z backgrounds)
- One hadronic au
- Veto *ee* events (→ suppress fake leptons)
- Veto *b* jets (→ not optimal for *tuh* and *tch* search!)

Optimized cuts

Example: recast CMS search for V + H production

Result:

	$\sqrt{y_{ut}^2 + y_{tu}^2}$	$BR(t \rightarrow hu)$	$\sqrt{y_{ct}^2 + y_{tc}^2}$	$BR(t \rightarrow hc)$
Multilepton	< 0.19	< 0.01	< 0.23	< 0.015
Diphoton plus lepton	< 0.12	< 0.0045	< 0.15	< 0.0066
Vector boson plus Higgs	< 0.16	< 0.0070	< 0.21	< 0.012

- Analysis 1: $pp \rightarrow \overline{t}(t \rightarrow hj) \rightarrow$ hadrons
 - Tagging SM $t \rightarrow Wb$ decays: HEPTopTagger
 - Plehn Salam Spannowsky Takeuchi Zerwas, arXiv:0910.5472, 1006.2833
 - Cluster "fat jets" (R = 1.5)
 - Uncluster to find three subjets most likely to originate from top decay based on their invariant mass m₁₂₃
 - Along the way, use filtering to remove pile-up and underlying event contamination
 - * Impose cuts on invariant masses of subjet pairs to require one pair to be $\sim m_W$
