Interfacing EOS WET likelihoods to a SMEFT analysis

Matthew Kirk

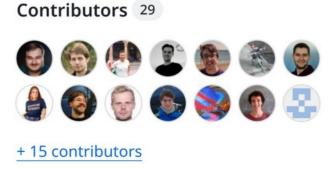

SMEFT Tools 2025 27 Jan 2025

EOS

- Software for flavour physics phenomenology
- C++ backend, Python front-end
- Can be used via Jupyter notebook or CLI
- Developed by

What is EOS designed to do?

- 1) Calculate state of the art theory predictions
- 2) Fit theory parameters and/or observables from data
- 3) Produce Monte-Carlo pseudo-event samples

Theory predictions

 As of v1.0.13, more than 1300 (pseudo-)observables in a variety of processes

☐ List of Observables

- oxdot Observables in (semi)leptonic b-hadron decays
- oxdot Observables in (semi)leptonic c-hadron decays
- ⊕ Observables in rare (semi)leptonic and radiative b-hadron decays
- ⊕ Observables in neutral meson mixing
- Pseudo-observables for the non-local form factors
- ⊕ Observables in scattering processes

Theory predictions

 Most processes have a variety of underlying parameterisations available (e.g. for hadronic physics, ...) which can be selected at run time

☐ List of Observables

- oxdot Observables in (semi)leptonic b-hadron decays
- oxdot Observables in (semi)leptonic c-hadron decays
- ⊕ Observables in rare (semi)leptonic and radiative b-hadron decays
- ⊕ Observables in neutral meson mixing
- Pseudo-observables for the non-local form factors
- ⊕ Observables in scattering processes

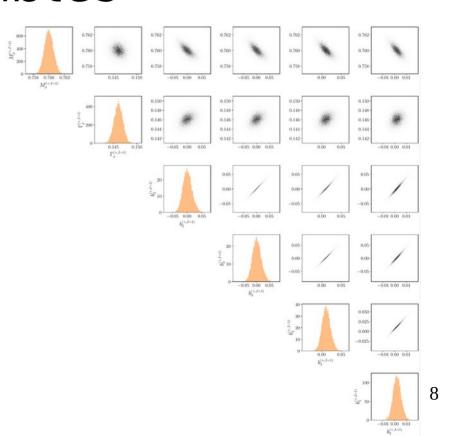

- EOS uses Bayesian approach specify prior probability and likelihood from experiment, and find posterior probability of parameters
- Analysis in EOS is done in the WET (/ LEFT), so parameters include WET coefficients

- Specify priors on your parameters
- Specify likelihoods for observables that depend on your parameters

- EXP-JLAB

 Use nested sampling (specifically dynesty) to generate weighted samples corresponding to the posterior

 Which can be used to predict observables

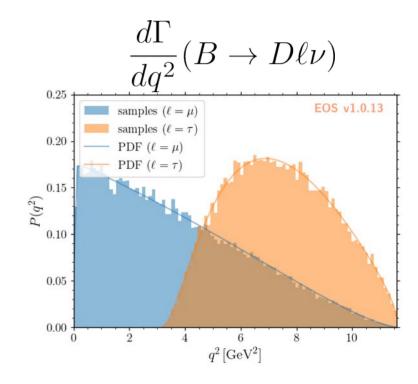

Monte-Carlo samples

- 27 SignalPDFs predefined in EOS
- Built in functions to sample from them

Monte-Carlo samples

- 27 SignalPDFs predefined in EOS
- Built in functions to sample from them
- E.g. look at differential distributions of $B \to D\ell\nu$

Using EOS for SMEFT

- All constraint information from EOS is in the language of WET / LEFT
 - Available datasets can be found at: https://github.com/eos/data/
- So how can you use them in a SMEFT analysis?

Using EOS for SMEFT

- Let's say you are studying BSM (either specific model or SMEFT)
- After RG running, you expect effects in some low energy B physics observables
- E.g. $B \to \pi \ell \nu$

ABSTRACT: We fit the available data on exclusive semileptonic $b \to u \ell^- \bar{\nu}$ decays within the Standard Model and in the Weak Effective Theory. Assuming Standard Model dynamics, we find $|V_{ub}|=3.59^{+0.13}_{-0.12}\times 10^{-3}$. Lifting this assumption, we obtain stringent constraints on the coefficients of the $ub\ell\nu$ sector of the Weak Effective Theory. Performing a Bayesian model comparison, we find that a beyond the Standard Model interpretation is favoured over a Standard Model interpretation of the available data. We provide a Gaussian mixture model that enables the efficient use of our fit results in subsequent analyses beyond the Standard Model, within and beyond the framework of the Standard Model Effective Field Theory.

Using EOS for SMEFT

- You see this paper
- With this result for a likelihood on WET coefficients:

Using EOS for SMEFT

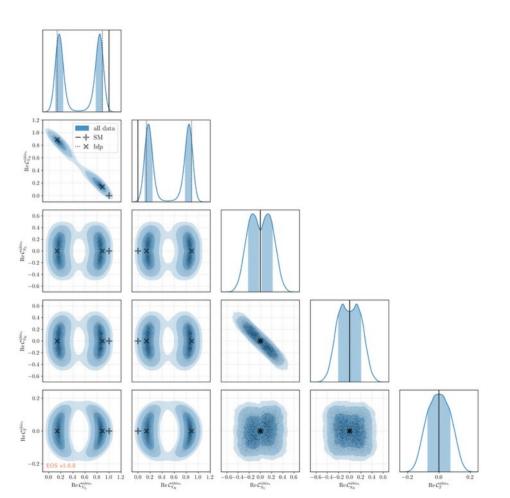

- You want to include this likelihood in your fit
- But it's not a nice simple Gaussian or anything...

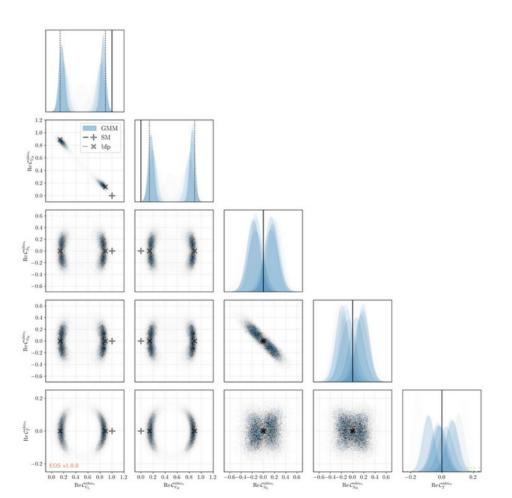

Gaussian Mixture Model

Approximate the posterior distribution as a sum of normal distributions

Gaussian Mixture Model

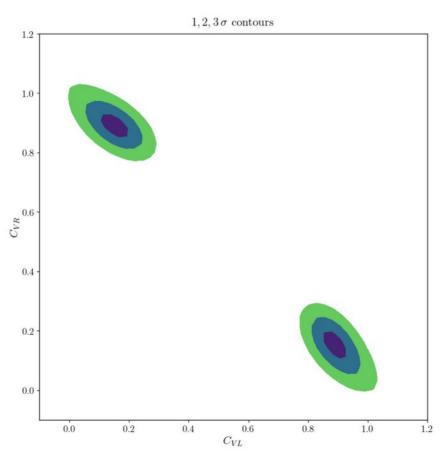

Gaussian Mixture Model

plt.plot(x_vals, chi2_data)
```

Going beyond GMMs

- Nabu: very much a WIP
 - A code to use machine learning to learn complicated (e.g non-gaussian) likelihoods.
- Once complete, EOS will use it to make likelihoods available
- Watch this (eoshep.org) space
