

# m<sub>top</sub> perspectives at the future linear collider

Cluster of Excellence Precision Physics, Fundamental Interactions and Structure of Matter

J. Fuster, IFIC-Valencia (thanks to F. Simon for providing material)

High precision fundamental constants at the TeV scale 10-21 March 2014 Mainz, Germany

- General introduction to the e+e- future linear collider
- Experimental strategies to measure the top-quark mas in e+e-:
  - ✓ Threshold scan
  - ✓ Invariant mass reconstruction
  - $\checkmark$  Other observables sensitive to the top-quark mass
- Summary

# Update of the European Particle Strategy

Proposed Update of the European Strategy for Particle Physics concerning LHC and HL-LHC:

The discovery of the Higgs boson is the start of a major programme of work to measure this particle's properties with the highest possible precision for testing the validity of the Standard Model and to search for further new physics at the energy frontier. The LHC is in a unique position to pursue this programme. Europe's top priority should be the exploitation of the full potential of the LHC, including the high luminosity upgrade of the machine and detectors with a view to collecting ten times more data than in the initial design, by around 2030. This upgrade programme will also provide further exciting opportunities for the study of flavour physics and the quark gluon plasma.

#### The LHC and HL-LHC is highest priority for Europe HEP

#### Proposed Update of the European Strategy for Particle Physics concerning ILC and CLIC activities:

- To stay at the forefront of particle physics, Europe needs to be in a position to propose an ambitious post-LHC accelerator project at CERN by the time of the next Strategy update, when physics results from the LHC running at 14 TeV will be available. CERN should undertake design studies for accelerator projects in a global context, with emphasis on proton-proton and electron positron high-energy frontier machines. These design studies should be coupled to a vigorous accelerator R&D programme, including high-field magnets and high-gradient accelerating structures, in collaboration with national institutes, laboratories and universities worldwide
- There is a strong scientific case for an electron-positron collider, complementary to the LHC, that can study the properties of the Higgs boson and other particles with unprecedented precision and whose energy can be upgraded. The Technical Design Report of the International Linear Collider (ILC) has been completed, with large European participation. The initiative from the Japanese particle physics community to host the ILC in Japan is most welcome, and European groups are eager to participate. Europe looks forward to a proposal from Japan to discuss a possible participation

#### The LC community has received these recommendations very well and very positively

### Physics at Linear Colliders from 250 GeV to 3000 GeV

- Higgs physics (SM and non-SM)
- **Top**
- SUSY
- Higgs strong interactions
- New Z' sector
- Contact interactions
- Extra dimensions
- ....
- ILC and CLIC physics case is very similar, (energy range, technical readiness are the issue)

J. Brau et al.	The Physics Case for an e+e- Linear Collider, arXiv:1210.0202	
L. Linssen et al P. Lebrun et al	CLIC CDR, arXiv:1202.5940,1209.2543	
H. Baer et al.	ILC Technical Design Report, Volume 2, Physics at the International Linear Collider, 2013	

- Elementary interactions at known E<sub>cm</sub>
- Democratic cross section (i.e., signal and background events of similar size)
- Inclusive trigger-free data
- Use of polarized electron beam (80%).
   Positron polarization being investigated (>30%)
- Calorimetry with Particle Flow Precision (introduced at LEP, developed at LC R&D, used already at LHC)  $\sigma_{E} / E_{jet} \sim 3\% \qquad \text{for } \text{E}_{jet} > 100 \text{ GeV}$
- Excellent vertex reconstruction
- $R_{\text{beanpipe}} \sim 1 \text{ cm and } \sigma_{\text{hit}} \sim 3 \mu \text{m}$ , H-> cc
- Model independent measurements

# EW-fits

### **G-fitter experimental inputs**

- Latest experimental inputs:
  - Z-pole observables: from LEP / SLC [ADLO+SLD, Phys. Rept. 427, 257 (2006)]
  - $M_W$  and  $\Gamma_W$  from LEP/Tevatron [arXiv:1204.0042]
  - m<sub>top</sub> : average from Tevatron [arXiv:1207.1069]
  - m<sub>c</sub>, m<sub>b</sub> world averages (PDG) [PDG, J. Phys. G33,1 (2006)]
  - $\Delta \alpha_{had}^{(5)}(M_Z^2)$  including  $\alpha_S$  dependency [Davier et al., EPJC 71, 1515 (2011)]
  - M<sub>H</sub> from LHC [arXiv:1207.7214, arXiv:1207.7235]

#### • 7+2 free fit parameters:

- $M_Z$ ,  $M_H$ ,  $\alpha_S(M_Z^2)$ ,  $\Delta \alpha_{had}^{(5)}(M_Z^2)$ ,  $m_t$ ,  $\overline{m}_c$ ,  $\overline{m}_b$
- 2 theory nuisance parameters
  - δM<sub>W</sub> (4 MeV), δsin<sup>2</sup>θ<sup>1</sup><sub>eff</sub> (4.7x10<sup>-5</sup>)

$M_H \ [\text{GeV}]^{(\circ)}$	$125.7\pm0.4$	LHC
$M_W$ [GeV]	$80.385 \pm 0.015$	Toyotrop
$\Gamma_W$ [GeV]	$2.085\pm0.042$	Tevation
$M_Z$ [GeV]	$91.1875 \pm 0.0021$	
$\Gamma_Z$ [GeV]	$2.4952 \pm 0.0023$	
$\sigma_{ m had}^0$ [nb]	$41.540 \pm 0.037$	LEP
$R^0_\ell$	$20.767\pm0.025$	
$A_{ m FB}^{0,\ell}$	$0.0171 \pm 0.0010$	
$A_\ell \ ^{(\star)}$	$0.1499 \pm 0.0018$	SLC
$\sin^2 \theta_{\rm eff}^{\ell}(Q_{\rm FB})$	$0.2324 \pm 0.0012$	
$A_c$	$0.670 \pm 0.027$	
$A_b$	$0.923 \pm 0.020$	SLC
$A_{ m FB}^{0,c}$	$0.0707 \pm 0.0035$	LED
$A_{ m FB}^{0,b}$	$0.0992 \pm 0.0016$	LEP
$R_c^0$	$0.1721 \pm 0.0030$	
$R_b^0$	$0.21629 \pm 0.00066$	SLC
$\overline{m}_c$ [GeV]	$1.27^{+0.07}_{-0.11}$	
$\overline{m}_b$ [GeV]	$4.20^{+0.17}_{-0.07}$	
$m_t \; [\text{GeV}]$	$173.18\pm0.94$	Tevatron
$\Delta \alpha_{\rm had}^{(5)}(M_Z^2) \stackrel{(\triangle \bigtriangledown)}{\to}$	$2757 \pm 10$

### Japan – Preferred Site selection

"Issues that could lead to particularly serious difficulties for the Sefuri site are that the route passes under or near a dam lake, and that the route passes under a city zone.

Also, the lengths of access tunnels are longer for the Sefuri site than for the Kitakami site leading to a large merit for the latter in terms of cost, schedule, and drainage"

Site-A

**KITAKAMI** 

- Japanese Mountainous Sites -

### North side selected

# ILC in a glance

- 200-500 GeV  $E_{cm} e^+e^-$  collider L ~2×10<sup>34</sup> cm<sup>-2</sup>s<sup>-1</sup>
  - upgrade: ~1 TeV
  - SCRF Technology
    - 1.3GHz SCRF with 31.5 MV/m
    - 17,000 cavities
    - 1,700 cryomodules
    - 2×11 km linacs
- Developed as a truly global collaboration
  - Global Design Effort GDE
  - ~130 institutes
  - http://www.linearcollider.org/ILC

# Operating parameters at 500 GeV

Physics	Max. E <sub>cm</sub> Luminosity Polarisation (e-/e+) δ <sub>BS</sub>	500 GeV 1.8×10 <sup>34</sup> cm <sup>-2</sup> s <sup>-1</sup> 80% / 30% 4.5%

# CLIC detector and physics study

# Top-quark mass determination at Linear colliders

✓ M. Martínez, R. Miquel, Eur. Phys. J. C27 49 (2003)

✓ K. Seidel, F. Simon, M. Tesař, S. Poss, Eur. Phys. J. C73 2530 (2013) (no polarization)

 ✓ T. Horiguchi, A. Isihikawa, T. Suehara, K. Fuji, Y. Sumino, Y. Kiyo, Y. Yamamoto (with polarization)

- Pair production in s-channel e<sup>+</sup>e<sup>-</sup> annihilation
- Cross-section ~ 500 fb (350 GeV 500 GeV)
  - ✓ relevant backgrounds comparable in cross-section, up to a factor of ~ 10 higher
- Using key features of Linear Collider detectors:
  - ✓ Flavor tagging
  - $\checkmark$  Precise jet reconstruction with PFAs
  - Total energy measurement => Neutrino reconstruction
  - Possibility for kinematic fitting due to well-known overall energy

# Top-quark mass determination at Linear colliders

- ✓ Invariant mass of decay products
  - can be performed at arbitrary energy above threshold: high integrated luminosity
  - Interpretation in the context of event generator: "PYTHIA mass"

- theoretically well understood, can be calculated to higher orders
- needs dedicated running of the accelerator (but is also in a sweet spot for Higgs physics)
- ✓ Other observables above threshold (event shapes, ISR/FSR, etc..). Can include the "good" features of the above methods.

J. Fuster

K. Seidel, F. Simon, M. Tesař, S. Poss, Eur. Phys. J. C73 2530 (2013)

- Flavor-tagging to identify b-jets
- Kinematic fit imposing W mass, energy & momentum conservation
- Background rejection by kinematic fit & multivariate likelihood

- Very clean top identification with high (~35% 50%) efficiency, using high-BR decays
- Full detector simulations including backgrounds, integrated lumi 100 fb<sup>-1</sup>

channel	$m_{\rm top}$	$\Delta m_{ m top}$	$\Gamma_{ m top}$	$\Delta\Gamma_{ m top}$
fully-hadronic	174.049	0.099	1.47	0.27
semi-leptonic	174.293	0.137	1.70	0.40
combined	174.133	0.080	1.55	0.22

Total experimental systematics (JES,  $m_t$  assumption in MC,  $\ldots)$  of order 100 MeV

Theoretical uncertainties larger! (>100 MeV)

- Theoretical situation very impressive (see talk by J. Piclum)
- NNLO
   [Hoang, Teubner; Melnikov, Yelkhovsky; Yakovlev; Beneke, Signer, Smirnov; Nagano, Ota, Sumino; Penin, Pivovarov]

   NNNLO
   Intervention of the second seco
  - potential contributions [Beneke,
    - 3-loop static potential
    - ultrasoft corrections
    - 3-loop contribution to  $c_v$
- NNLL
  - vNRQCD
  - pNRQCD
- electroweak corrections
- finite-width effects
- most recent analysis:  $\frac{\delta\sigma}{\sigma}\Big|_{\text{NNLL}} = \pm 5\%$

[Beneke, Kiyo, Schuller; Kniehl, Penin, Smirnov, Steinhauser] [Anzai, Kiyo, Sumino; Smirnov, Smirnov, Steinhauser] [Beneke, Kiyo, Penin] [Marquard, JP, Seidel, Steinhauser]

> [Hoang, Manohar, Stahlhofen, Stewart, Teubner] [Pineda, Signer]

[Guth, Kühn; Eiras, Steinhauser; Kiyo, Seidel, Steinhauser]

[Fadin, Khoze; Hoang, Reißer, Ruiz-Femenía; Beneke, Jantzen, Ruiz-Femenía; Penin, JP]

[Hoang, Stahlhofen 2013]

K. Seidel, F. Simon, M. Tesař, S. Poss, Eur. Phys. J. C73 2530 (2013)

- The cross-section near the pair production threshold provides high sensitivity to the top mass - and can be calculated to higher orders
  - Using theoretically well-defined mass definition, 1S particularly well suited
- Experimentally: A cross-section measurement, using similar event selection techniques as for the invariant mass
- Simulation studies: Reconstruction efficiency and background levels from full detector simulations, NNLO cross section from TOPPIK (Hoang, Teubner)

K. Seidel, F. Simon, M. Tesař, S. Poss, Eur. Phys. J. C73 2530 (2013)

- Correlation of M<sub>t</sub> and α<sub>s</sub>: Simultaneous determination
- Experimental systematics (beam energy, luminosity, luminosity spectrum, background & efficiency, ...):
  - No dependence on location of scan energy
  - 5% uncertainty non-tt background, 18 MeV
  - 10<sup>-4</sup> precision on beam energy (machine parameters and LEP experience), 30 MeV
  - 20% uncertainty on lumi-spectrum, 75 MeV
- Theoretical uncertainties in 1S mass scheme comparable to statistical errors, currently O(100 MeV) due to additional uncertainty when translating to MS mass

1S top mass and $\alpha_s$ combined 2D fit			
$m_t$ stat. error 27 MeV			
$m_t$ theory syst. (1%/3%)	5 MeV / 9 MeV		
$\alpha_s$ stat. error	0.0008		
$\alpha_s$ theory syst. (1%/3%)	0.0007 / 0.0022		

### Total uncertainty ~100 MeV is in reach and can be further improved

T. Horiguchi, A. Isihikawa, T. Suehara, K. Fuji, Y. Sumino, Y. Kiyo, Y. Yamamoto

• Similar analysis as the one from K. Seidel et al. but including polarization, P(e+,e-)=(+-0.3,-+0.8)

	PS Mass (GeV)	Width (GeV)
"Left" (110 fb <sup>-1</sup> )	$172.000 \pm 0.020$	$1.399 \pm 0.026$
"Right" (110 fb <sup>-1</sup> )	$172.000 \pm 0.028$	$1.398 \pm 0.038$
"Left" + "Right" (220 fb <sup>-1</sup> )	$172.000 \pm 0.016$	$1.399 \pm 0.021$

 Obtained PS mass and width with statistical errors assuming 10 fb<sup>-1</sup> integrated luminosity and 11 energy points (340-350 GeV)

# Top-quark mass: other observables possible ?

• Angular effects (dead cone)

$$\theta_{\min} \sim \frac{m_q}{E}$$

Yu L Dokshitzer, V A Khoze and S I 'Tkoyan

$$\frac{1}{\sigma_0}\frac{d^2\sigma}{dx_1dx_2} = C_F \frac{\alpha_s}{2\pi} \left[ \frac{x_1^2 + x_2^2}{(1-x_1)(1-x_2)} - \frac{4m_q^2}{s} \left( \frac{1}{1-x_1} + \frac{1}{1-x_2} \right) - \frac{2m_q^2}{s} \left( \frac{1}{(1-x_1)^2} + \frac{1}{(1-x_2)^2} \right) - \frac{4m_q^4}{s^2} \left( \frac{1}{1-x_1} + \frac{1}{1-x_2} \right)^2 \right]$$

loffe, e+e- interactions LO-analytical expressions. (calculations exist at NLO, NNLO, NLL, NNLL, etc..)

# Top-quark mass: other observables possible ?

 Jet reconstruction algorithms introduce new scales which can increase the mass effects

$$s = E \bullet y \quad (y << 1)$$

• In general, gluon emission from quarks gets suppressed for heavier quarks

$$\frac{\sigma(QQG)}{\sigma(qqg)} \sim A(\alpha_s,\mu) + B(\alpha_s,\mu) \left(\frac{m_Q}{E}\right)^2 + \dots$$

M. Boronat, JF

Extracting the top-quark mas at 500 GeV in e+e- using tt+ $\gamma$  events

$B(m_t,\zeta_{S'})$	=	$\frac{d\sigma_{t\bar{t}+\gamma}}{d\zeta_{S'}}$

$$\zeta_{S'} = \sqrt{S'}$$

$$S' = S(1 - \frac{2 \cdot E_{\gamma}}{\sqrt{S}})$$

Stage	$L_a \ (fb^{-1})$	$\Delta^+ m_t (MeV)$	$\Delta^- m_t (MeV)$
1			
2	500	147	142
3	1000	102	100
4	2600	64	63

A simple exercise using Pythia and experimental  $\gamma$  identification and resolution as given by ILD simulation

## Summary and conclusions

- The Linear Collider study for physics and detector represents a tremendous effort of "many-many" people for "many-many" years (for more than 17 years).
- LHC and LC can complement extremely well and provide a physics programme for the next 20-30 years to continue exploring the mysteries of "symmetry breaking" in the Standard Model.
- In particular, the top-quark mass (m<sub>t</sub>) as an extremely important parameter of the SM which needs to be determined experimentally with high precision. Together with M<sub>W</sub> and M<sub>H</sub> plays a major role for testing the validity of the SM and also for New Physics models.
- Major developments both in theoretical calculations and experimental studies are still being performed despite the lack of resources
- A future measurement of m<sub>t</sub> at an e<sup>+</sup>e<sup>-</sup> Linear Collider with an accuracy better than 100 MeV is feasible including all uncertainties: statistics, theory and experimental systematics.
